Nursing Ethics

Covid-19, Ethical Nursing Management and Codes of Conduct: an analysis

Abstract:	The conduct of nurse managers, and health service managers more widely, has been subject to critique because of high profile organisational failures in health care. This raises concerns about the practice of nursing management and the use of codes of professional and managerial conduct. Some responses to such failures seem to assume that codes of conduct, will ensure or at least increase the likelihood that ethical management will be practised. Codes of conduct are general principles and rules of normative standards, including ethical standards, and guides for action of agents in particular roles. Nurse managers stride two roles. Contra some accounts of the roles of a professional (nurse) and that of a manager it is claimed there is no intrinsic incompatibility of the roles though there is always the possibility that it could become so and likewise for codes of conduct. Codes of conduct can be used to support nurse managers in making practical decisions via an 'outside in' approach with an emphasis on the use of principles and an 'inside out' approach with an emphasis on the agent's character. It is claimed that both approaches are necessary, especially as guides to ethical action. However, neither is sufficient for action because judgement and choice will always be required (principles always underdetermine action) as will a conducive environment that positively influences good judgement by being supportive of the basic principles and values of healthcare institutions. The response to the Covid-19 pandemic has created a unique set of circumstances in which the practical judgement, including ethical judgement, of nurse managers at all levels is being tested. However, the pandemic could be a turning point because staff and institutions (temporarily) freed from managerialism have demonstrated excellent practice supportive of ethical and other practical decisions. Organisations need to learn from this post pandemic.

Covid-19, Ethical Nursing Management and Codes of Conduct: an analysis

Abstract

The conduct of nurse managers, and health service managers more widely, has been subject to

scrutiny and critique because of high profile organisational failures in health care. This raises

concerns about the practice of nursing management and the use of codes of professional and

managerial conduct. Some responses to such failures seem to assume that codes of conduct, will

ensure or at least increase the likelihood that ethical management will be practised. Codes of

conduct are general principles and rules of normative standards, including ethical standards, and

guides for action of agents *in particular roles.* Nurse managers seem to stride two roles. Contra

some accounts of the roles of a professional (nurse) and that of a manager it is claimed that there is

no intrinsic incompatibility of the roles though there is always the possibility that it could become so

and likewise for codes of conduct. Codes of conduct can be used to support nurse managers in

making practical decisions *via* an 'outside in' approach with an emphasis on the use of principles and

an 'inside out' approach with an emphasis on the agent's character. It is claimed that both

approaches are necessary, especially as guides to ethical action. However, neither is sufficient for

action because judgement and choice will always be required (principles always underdetermine

action) as will a conducive environment that positively influences good judgement by being

supportive of the basic principles and values of healthcare institutions. The response to the Covid-19

pandemic has created a unique set of circumstances in which the practical judgement, including

ethical judgement, of nurse managers at all levels is being tested. However, the pandemic could be

a turning point because staff and institutions (temporarily) freed from managerialism have

demonstrated excellent practice supportive of ethical and other practical decision. Organisations

need to learn from this post pandemic.

2

Hybrid nurse managers, codes of conduct, codes of ethics, healthcare management, ethical management

Introduction

Nursing management is central to the effective organisation and delivery of care in the UK and internationally. [1][2] However, the conduct of nurse managers and health service managers more generally, has been subject to scrutiny because of a number of high profile organisational failures in health care. For example a large scale hospital failure in England was caused in part by the existence of a culture where staff were scared to speak out about poor standards of care because of the attitude and behaviour of managers.[3] Similarly Lakeman and Molloy [4] have questioned the quality of leadership of mental health nursing in Australia and the harm that can result from 'toxic nursing leadership' has been identified in the United States.[5] This issue has assumed even greater significance as nurse leaders face the challenge of managing the service response to the COVID-19 pandemic.[6] The practice of registered nurses is governed by a code of professional conduct to ensure the interests of patients are paramount and standards of professional practice are 'not negotiable or discretionary'[7]. In view of this it is important to consider the role of codes of conduct in nursing management in order to examine how failures in the past have occurred and whether such codes are helpful to nurse managers in their approach to the COVID-19 pandemic.

Background

Managers and their conduct have been implicated in serious failings in health care over many years. For example, Walshe [8] examined a selection of ten major inquiries conducted into organisational failures in the publicly funded UK National Health Service (NHS) over the period 1969 to 2001. A common theme was inadequate leadership by managers and clinicians including weak or bullying management styles, and reluctance to tackle problems even in the face of extensive evidence.

3

Subsequently there have been many other major systemic failings within the NHS and

internationally. [9] [10] [3] [4] There have also been failings in public life more broadly contributing to the

creation of an environment in which *trust* in public institutions has been undermined. [11]

The response to such failings has included the introduction of codes of conduct for public officials, [12]

managers, [13] [14] revisions to professional codes for nurses [15] (and doctors [16]), to include a duty of

candour[17] for example, fundamental standards, and virtue terminology such as compassion. Also, in

the UK an expert group was convened to conduct a review of standards in public life.[18] The group set

out seven principles for public life which were: selflessness, integrity, objectivity, accountability,

openness, honesty, and leadership and they have been incorporated in the Ministerial Code, [19] . The

need to review standards in public life is also an issue of global concern, reflected in the creation of

international codes and principles for public officials.[20] This has resulted in the development of a

number of specific codes for managers in healthcare organisations such as the NHS[21] which were

modelled on the Institute of Health Care Management Code[22] designed to apply to independent

providers, healthcare consultants, and the armed forces as well as the NHS. In contrast to the

comparatively recent introduction of managerial codes of conduct, healthcare professionals have

been bound by professional codes of conduct for many years as a means of codifying the duty of

care and setting standards of professional practice.

The development of codes of conduct in response to concerns about failures in health care and

public conduct more generally seems to derive from an assumption that they will ensure or at least

increase the likelihood that ethical management will be practised. Codes of conduct normally

include ethical principles and rules. The regaining of trust by public healthcare organisations and the

trustworthiness of practitioners, including nurse managers, involves adherence to these ethical

principles and rules. The changes to existing professional codes and the introduction of new codes of

conduct for managers can perhaps be seen as evidence of a recognition of this, arising from an

4

assumption they will have a positive effect on actions and demonstrate a commitment to patient care. [23] The current COVID-19 pandemic has thrown many nursing leadership and management issues into sharp relief. Opportunities to process decisions and access to a reflective space are important for nurse managers, in order that they can process the difficult decisions need to make when faced with challenges COVID-19 presents.[24] Codes of conduct may help them do this in two ways: an 'outside in' approach or an 'inside out' approach. [25] [26] Both approaches are necessary though not sufficient.

Because codes of conduct provide standards and action guides for a defined group of people (a profession for example), and nurse managers can be members of two groups-nursing and management, the next section will briefly explore the role of the nurse manager in order to demonstrate there need be no intrinsic incompatibility between the two groups, though there is always the possibility it could become so, before examining the role of codes of conduct for ethical nurse management.

The role of the nurse manager

The role of the nurse manager can be defined in different ways. [27] If the variety of routes into, and forms of nurse management are considered arriving at a definition that encompasses all types of nurse managers is difficult.[28] This itself may be problematic for deciding what it is that nurse managers should do as well as how they should be. For this discussion, a nurse manager is defined as a person who is a nurse and also a manager. It is a 'hybrid' role [27] 'combining' managerial and professional responsibilities, values, and dispositions in order to organise and deliver care. It involves co-ordination of autonomous skilled workers with authority based on trust and a service ethic as core professional values and responsibility for quality balanced with the need to achieve organisational targets, such as reductions in waiting times, and accountability for measurable results, such as reduction in hospital based infections.[29] (p.190) The responsibilities and values are

5

set out in a code of conduct and part of the professional disposition is to work by the code,[30] so

there will also be a hybridisation of dispositions. There seem to be two broad positions or ideal

types[29] that could make the *ethos* of management and professional *roles* different, perhaps even

intrinsically different, a managerial approach and an essentialist approach to the professions.[31][32][33] It

is recognised that as a strict dichotomy this is inaccurate, however it is one that appears as a

recurrent theme in the literature.[29][31][32][33][34][35]

There has been much critical commentary about the suitability of a managerial approach in health

care (whether privately or publicly organised) and indeed public services more generally. For

example, Ranson and Stewart[36] argued that because the public sector has *fundamentally* different

purposes, values, and conditions from those of the private sector, models founded on commercial

principles of the private sector were unsuitable. Public managers have to balance client needs, with

the policy driven nature of the service rendering it unique. As a consequence, private sector

prescriptions for improving public management were inherently flawed. Dopson and Stewart[37]

found that public sector managers saw commercially based practices as inimical to public services

because they undermined their core values and sense of professional identity. The fact that public

service *managers* felt that their core values were undermined by managerial approaches is an

important point showing that the term manager and management (at least in public services) need

not be equated with managerialism. [29][37]

But the need for a different identity and distinct set of core values for healthcare professionals such

as nurses has been expressed in *moral* terms whereby some have posited a clear demarcation, as

intrinsic incompatibility, because of an 'internal morality' based on an essentialist nature of the

profession concerned.[32][33][34]   The role of manager has been characterised as having external norms

that do not always coincide with the good of the patient and may even be harmful, because it is

focussed on 'business' concerns such that the commitment to certain values, in this case a public

6

service *ethos* of providing a service of necessary goods or values such as justice, education and

healthcare, or more specifically commitment to patient care and to improving patient care[23], is lost,

corrupted or overlooked.[32 33 34]

However, an 'essentialist' account of the nature of nursing or any other profession, is difficult to

justify[38] and is not an accurate reflection of contemporary practice[39] (although strictly speaking the

latter point could be seen as irrelevant from an essentialist position which could simply state that

contemporary nursing practice was morally wrong[32] or morally corrupted[34]). And in relation to

nursing and management *roles* nursing at all levels has always included elements of management.[39]

So, it is not plausible to make a distinction between nursing and healthcare management on moral

grounds alone. It is more accurate to suggest that a nurse manager is an ethical role but with

different foci and scope. The type of good or value that nurse managers can provide for the patient

will vary on a continuum from immediate physical and psychological outcomes achieved as a result

of frontline nurse managers organising and leading safe high quality clinical care, to the more

indirect, though no less important goods or values, of fair distribution of resources and quality

services reflecting the contribution of nurse managers undertaking middle management and

executive level roles.[40] Their involvement in managing the wider institution has the moral goal of

ensuring the wellbeing of patients. At all levels it is reasonable to suggest that nurses in such roles

draw on elements of nursing and management and are thus hybrid in nature. Indeed, Causer and

Exworthy [41] identified three broad roles that reflect points on this 'hybrid' continuum-practising

professional; managing professional; and general managers. Thus, the artificial separation of the

professional role from the manager role in health care is an inaccurate and unhelpful

characterisation.

Codes of conduct

7

As the background section suggests, in the wake of healthcare failures there seems to be an

assumption that following codes of conduct will help to ensure ethical conduct. There are

differences between codes of ethics, codes of conduct and codes of (professional) practice, with the

former regarded as 'aspirational' and the latter two as regulative rules. However the terms are often

equated for example Spielthenner [42] argues codes of ethics are created by professionals for various

reasons but then states "It is hardly surprising, therefore, that ethics learning and teaching often

takes its starting point from professional codes of practice…"(p. 195). Usually, codes of conduct

include moral principles and rules as well as non-moral, particularly legal, rules and are written in

prescriptive and descriptive language.[43]   In this section we use the term code of conduct because its

focus is on their use and proceeds from the assumption that whether it be legal or moral principles

or rules in the code its aim (be it in spirit or in letter) is to ensure *good*, understood as ethical

conduct not just good enough conduct,[43] is the outcome. Here a distinction between ethical

motivation and prudential motivation and ethical principles and prudential principles may be

pertinent with good enough conduct being motivated by self-interest of avoiding legal sanctions but

in many cases it is the outcome that ultimately matters.

Codes of conduct set standards and are guides to action and it has been argued they can do this in

two ways; by means of an 'outside in' approach or an 'inside out' approach.[25][26] With an outside in

approach the *emphasis* for action guidance is on the use or following of principles and rules;

whereas with an inside out approach the emphasis is on the agent's character or ability for

situational appreciation.[25][26] Some responses to the systemic failings in NHS care reflect both

approaches. For example, it has been claimed that nurses lacked good character and the moral

ability to 'see' what was happening around them such as patients being left in soiled bed clothes for

lengthy periods of time and water left out of reach.[3] The response was to promote virtue terms[44][45]

and emphasise them in the principles and rules of revised codes of conduct.[7][15][16] This may be a

8

form of (re) 'ethicisation' of professional codes of conduct,[44] through refocussing on the moral

objective of the code, the need for education, the importance of moral disposition, and sensibility, [44]

and the requirement for particular character attributes such as honesty and integrity.

Yet there are concerns about both outside in and inside out approaches to understanding codes of

conduct as guides to action. These include criticism that , that principles within codes are too

abstract to be useful and that codes prescribe rigid conformity of action that is inappropriate for the

specific and complex situations of nursing practice.[46] [26] Moreover abstraction, is conflated with

idealisation which is unhelpful because, patients, and nurses are human beings, not idealised

agents.[46] Although all practical reasoning involves abstraction to a greater or lesser degree,[46] the

idea that adherence to rules requires *uniformity* in action is not necessarily accurate and may have

arisen from a misunderstanding of rule following.[46] So (like everyone else), nurse managers need to

be able to follow principles and rules intelligently (Kant and Mill both recognised this) and interpret

both of their codes of conduct as well as discuss what their codes should be.[30]

The difficulty with an inside out approach is the inherent relativism and even loss of normativity

involved.[46] For example as a code of conduct *for nurses*, the relativism is inherent.[30] Whereas the

inside out approach may lead to a loss of *role* specific guidance because of the reliance on an

individual's situational appreciation, which may not encompass the importance of the norms of the

professional role or indeed norms for others.[23] [46] [47] [48] [49] [50] The nurse manager may have contingent

problems should her situational appreciation be divided between that of a nurse and that of a

manager construing things with a different (not distinct) emphases.[49]   Thus, contra some accounts

of strongly particularistic views in morality particularly virtue ethics,[47] both outside in and inside out

approaches to following principles and rules within codes of conduct are required. But even when

adhered to by a virtuous nurse manager codes of conduct are not sufficient for ethical action

because judgement and choice are always ultimately required.[46] [25] Judgement involves deciding to

9

do once the many practical principles intended to guide action have been considered, and because

they must remain at least somewhat indeterminate there will always be a gap between principles

and act.[46] This is unlike the judgement made by a professional or regulatory body or an individual

after the act when what has been done is known. Hence some pertinent critiques of codes of

conduct about how clearly or otherwise they have been written and can be interpreted especially

when used in a regulatory and disciplinary function.[43]

The regulatory function of some professional codes of conduct is unlike managerial codes.

Professional codes of conduct are used by the respective regulatory bodies as a 'benchmark' for

acceptable professional practice and a breach can be sanctioned by removal of the practitioner from

the register which means they can no longer work a professional.   In contrast if managers are

dismissed they can be re-employed. For example, in 2015 it was reported that the average tenure of

an NHS Chief Executive was 2 years and 4 months.[51] Nurse managers thus have an additional and

important concern to consider in their actions that managers who are not nurses do not.

Codes *and* character can only do so much because in the environment of practice there are social

pressures and economic forces that affect judgement and behaviour.[50 51 52] For example "Where

existing realities force hard choices it may be impossible to meet all of the various requirements-

ethical and legal, prudential and social, technical and professional- that agents take seriously"[46] (p.

208). The environment matters and the Covid-19 pandemic has highlighted both the need for ethical

and other practical judgements to be made frequently by nurse managers in a complex, difficult and

rapidly changing environment. Yet, it has somewhat paradoxically provided or emphasised means to

do so.

The environment of practice and the covid-19 pandemic

Major ethical failings occur in healthcare organisations despite the existence of codes of conduct and

other codifications of behaviour, such as the law and national guidelines. The results of enquiries

10

have consistently identified the organisational environment as the main cause.[53] It is important to

recognise this if expectations of what codes of conduct or ethics can do for nurse managers and

decision making are to be realistic. An extreme example of how the broader cultural and political

environment can adversely affect healthcare is given by Manea[54] (p. 28) who found that "When

working in other Western countries, Romanian doctors behaved as professionally as their

colleagues, following the same high standards." Whereas in Romania where there is widespread

corruption and bribery is common among people employed in the healthcare sector they were

unable to practice to such standards.[54] Even assuming people who work in healthcare organisations

are good people, are of good character and seek to adhere to their respective codes of conduct, a

supportive working environment is also necessary. This suggests that rather than introducing new

principles, new codes, new regulations and regulators, it would be more helpful to address ethical

and other standards at an organisational level across the public sector, and indeed more widely.[55]

The Covid-19 pandemic has created a situation in which health care has refocused on its core

mission (particularly in the acute care setting) and the need to respond rapidly to the challenge of

dealing with a new and largely unknown disease has created a situation in which there is 'freedom'

to make changes. E.g. increased telemedicine; remote consultations; system innovation (COVID and

Non covid areas) in order to cope with the crisis and keep 'normal' services going. [56] In a

MacIntyrean sense the external goods of the institution and the internal goods of the practices of

healthcare professions are both focused on the core good of healthcare[34 40] rather than the

institution being *excessively* focused on external goods, some of which may be unacceptable to

practice and the aims of public service.[40 44 46] What the pandemic may be demonstrating is that freed

from the full brunt of managerialial[29] control ethical nurse management can be practiced because

of, rather than despite, rapid change, and high levels of risk and uncertainty.

11

The organisation and delivery of care during the Pandemic has resulted in numerous examples of

innovative practice that facilitates ethical nurse management by providing support to make

decisions and appropriate space in which to make them. In a way it facilitates the *idea* behind 'slow

ethics'[57], albeit in the midst of rapid change in a pandemic, with a focus on taking (some) time for

contextualised listening, engagement, and support for moral *and other* practical concerns with the

focus on patient care. For example, one US hospital created a "continuum of staff support within

the organisation"[55] (p. 822) alongside effective leadership and management for resilience and

information for empowerment claiming that if workers feel supported in a disaster they will be more

resilient. This supports the idea that sole focus on individual (often nurse) resilience is likely to fail.[26]

[55] The pandemic has shown how team support, often where teams are changing or include staff who

are not usually part of the team, is crucial.[24] For example, adapted Schwartz rounds conducted more

rapidly have been used during the pandemic involving nurse managers with direct patient facing

roles.[30] The pandemic has demonstrated the need for relational-based forms of leadership

development and for senior leaders to support middle managers/mid-level leaders[59] such as nurse

managers. Virtue ethics and care ethics inspired accounts of management, sometimes called

'organisational ethics' [39 60 61] are examples of relational-based forms of management. During the

pandemic there has been a greater emphasis on the importance of relationships both vertical,

between leaders and their teams as well as horizontal, between colleagues for integration of

support networks.[30 62] Experience of the pandemic has led some to advocate that:

> Rather than re-establishing the old health system that led us to an epidemic of burnout, we
>
> need to engage all team members in rebuilding new, higher-functioning systems that
>
> promote workforce well-being[60] (p. 2).

Part of the promotion of work force well-being should include cultural leadership strategies[60] which

are crucial to the facilitation of practical decision making and perhaps especially ethical decision

making within organistaions.[63] Some of these strategies have been identified above because enable

12

practical decision making in ethical situations where the epistemology and ontology are different

from that required in empirical practical decisions.[62] Indeed, there is an opportunity here to '…draw

energy and inspiration from the renewed support and admiration for nurses and the broader health

workforce that we see through applause…around the world'[59] (p4) that has been evident in the

pandemic to develop a wider sense of trust[64] to support nurses and nurse managers. The relational

based forms of leadership and organisational ethics facilitate open communication, which in turn

facilitates sharing of values and opinions which prevents the development of silo cultures[63] and the

negative impact they can have on health care organisations. Relational leadership can also improve

judgements by helping to acknowledge and reduce indeterminacy in order to foster agreement on

what should be done.

> Agreement on principles and rules is not enough to resolve indeterminacy, which also needs
>
> discussion and communication, which can be enabled by cultures that support effective
>
> understanding of others views and proposals (p. 407).[63]

The pandemic has sharpened the focus on healthcare's core values and created a situation in which

nurse managers feel able to enact them[62] [63]. The pandemic could be a turning point where recourse

to codes of conduct will be facilitated, not replaced, as the environment of care in this broad sense

becomes a support to ethical nursing management.

7.Conclusion

The current pandemic is 'uncharted territory' for all nurses, including nurse managers. As COVID-19

continues healthcare professionals face a range of practical problems, many of which are ethical in

nature. In such times of uncertainty and distress professional codes of conduct are essential and can

provide some guidance to support nurse managers navigate the myriad challenges they face.   They

can serve as a point of reference in situations nurse managers are likely to have never experienced

before serving as an 'ethical compass' for nurse managers in a time of uncertainty and challenge, but

13

the need for good judgement will always remain. This can be facilitated and encouraged if the

current environment of trust can be continued post pandemic.
