From fried egg to mashed potato and lentils: navigating positionalities in ethnographic research in a global south context

Md Shajedur Rahman 🆔

School of Education, University of Birmingham, Birmingham, UK

ABSTRACT

The current debates in the area of researchers' positionalities criticize the notion of the 'insider/outsider' dichotomy and favour the idea of a fluid inbetweener position. However, these narratives foreground researchers' perspectives and often ignore participants' agency in constructing a researcher's positionality in the field. In this paper, as an early career researcher, I analyze my journey with my own positionalities in ethnographic research in a rural community in Bangladesh. Adopting a Critical Realist ontological standpoint, I argue that positionalities are co-constructed by researcher and participant and are products of complex interactions between their agencies and the social structure. I illustrate how reflexivity, taking both my and the participants' views into account, facilitated my movement towards a position where the participants expose their habitual behaviour (not hesitating to offer their day-to-day food – mash potato) rather than providing superficial information (as they do to a guest, for whom they will at least fry an egg – a special arrangement – for dinner).

Introduction

Like other qualitative research methodologies, ethnography often encounters criticism as invalid and fuzzy (Hammersley 2006) and has long been theorized differently. One of the aspects of ethnographic research which has featured in debates is 'positionality': it has been argued that reflecting on the researcher's identities is crucial to make ethnography more 'valid' (Kaidesoja 2009). Although the term 'positionality' has become a buzzword in recent times (Milligan 2016), the debate around the concept is longstanding, evolving from prior to the popularisations of the technique of prolonged fieldwork by Bronislaw Malinowski (Young 2017). In this article, I offer the experience of an Early Career Researcher (ECR) and illustrate how I navigated my positions, in a Bangladeshi Primary school, during my fieldwork for my doctoral study (Rahman 2020).

Three aspects of this article are significant. First, this is an ECR account. An ECR's perspective is important because the way novice researchers make meaning of field experience shapes both their career and the knowledge they would produce in future. However, studies of ECRs' experience of research are scarce (Sala-Bubaré *et al.* 2022). Additionally, it can be helpful for ECRs to hear about others' experiences of ethnographic fieldwork for informed decisions.

The second aspect of significance is my researcher identity. I am a researcher born and had primary education in rural Bangladesh – a country in the Global South (GS). I also worked as an

educational researcher in Bangladesh. Yet, part of my higher education and research training was in the UK. The tension between my nativeness and the acquired knowledge from non-native system (Smith 2021) and how this is crucial in constructing positionalities is interesting to analyze.

The third contribution is the significance of the Global South (GS) context. Despite differences, GS countries share common features such as colonial legacies; hence, the GS term is used in a relational, not literal manner. People in GS countries often experience multiple temporalities, which are products of 'balanced' tensions and negotiations between unfinished pasts and unstable presents (Raghuram *et al*. 2014). The intersection between my researcher's identity and the respondents' post-colonial tensions results in a complex process of identity creation in the field.

I analyzed my positionalities and their effect on the data taking these three aspects into account because people's identity lies at the intersection of different social aspects (Trahan 2011, Collins and Bilge 2020) and it is the combination of these constructs that often shapes people's experiences.

I applied a Critical Realist (Bhaskar 2013) lens to do so. I considered the participants' and my agency as well as the social structure of the research context to understand and reflect on positionalities. I illustrated how I gained access to the community where the participants expose their habitual behaviour (not hesitating to offer their day-to-day food mash potato) rather than providing superficial information (as they do to a guest, for whom they will at least fry an egg – a special arrangement – for dinner). Before discussing the complexity around the notion of researcher positionality and my experience, I believe it is important to provide a brief account of my PhD study.

Study background and methodology

This paper depicts my reflection on my ethnographic PhD fieldwork explored the nature of teachers' collaboration (Rahman 2020) in a government primary school (state-run school) in Bangladesh – a south-Asian country. In my study, I answered the following research questions:

1. How is the concept of collaboration understood by teachers in a rural school in Bangladesh?
2. What is the nature of existing collaborative activities in the broader school context?
3. How do the factors related to teacher agency and social structure shape teachers' understanding and practice of collaboration?

The study was conducted in one rural government primary school in Bangladesh. Rural primary schools in Bangladesh are often understaffed (UNESCO 2015), and it was not easy to identify a school that has sufficient teachers to perform day-to-day collaborative professional interactions. Hence, I visited three schools in a rural Upazila (state administrative unit) to identify an appropriate school where professional interaction is comparatively more evident. After spending two days in each of the three schools, one school was selected for the actual study. The Upazila and three schools were selected with the help of one of my ex-colleagues, a teacher trainer in Bangladesh. Teachers' collaboration was more evident in the selected school than in the other two, and therefore the research site would yield data. Moreover, all the teachers at this school agreed to participate voluntarily in the study. Like typical government primary schools in Bangladesh, the school consists of seven classrooms and a staff room (where all the teachers and the headteacher sit), serving 593 students by twelve teachers, including the headteacher, during the fieldwork period. I conducted a single-site study for an in-depth understanding of the school community (teachers, students and other stakeholders, e.g. parents and school managing committee), the social structure of the school and the interplay between the two. Moreover, a multisite in-depth ethnography was beyond the capacity of a PhD researcher.

I carried out two months-long fieldwork when I attended the school each day from the beginning till the end of the school day. I observed teachers' activities inside and outside the school, interviewed them formally and informally, and audio recorded their staffroom conversations. Consents

were taken before audio recording their interviews and staffroom conversations. The activities were designed following BERA (2018) guidelines and were approved by my university ethics board.

Literature review

Ethnography is often defined as the tool for a first hand study of what people do and says in particular contexts (Hammersley 2006, Atkinson 2007); the importance has been on accessing a natural research context with the least interruption. Endeavours have been evident among educational ethnographers to access and understand such uninterrupted situations since the 1960s, and participatory observation has been becoming a popular tool for such purposes (Delamont 1975, Walker and Adelman 1976, Wragg *et al*. 1978, Measor and Woods 1984, Woods 1986). The inherent complexity of social life in educational settings took the centre of debate in educational ethnography studies (Bossert *et al*. 1977), and ethnographers started to become critical of the relationship between observers and observants in educational settings. Adelman *et al*. (1976) go on, 'What you see in a school will depend on how the school sees you.' (8). This debate is still in progress. Hammersley (2006) pointed 'our own behaviour affects what we are studying.' (5). How we see and are seen as researchers in an ethnographic context is dependent on our perceived location within the community. These locations are often seen within insider and outsider poles (Sultana 2007, DiAngelo and Sensoy 2009, Berger 2015, Milligan 2016, Krauss 2018). Researchers' positions and their effect on the knowledge gained are significant concerns in recent educational ethnography.

While some scholars defined positionality as a 'placement' resulting from the relationships between researcher and researched (Anthias 2002), which are featured with a complex web of cultural values, beliefs and experiences (DiAngelo and Sensoy 2009), others explained positions as the status of a researcher dependent on his/her personal characteristics including race, age, sexual orientation, organizational and cultural affiliations (Naples 1996, Bradbury-Jones 2007, Berger 2015, Bettez 2015). Most scholars foreground researchers' characteristics and the context but ignore participants' agencies when engaging in the debate around 'positionality'. Such an approach has contributed to developing an 'insider/outsider dichotomy where a researcher is considered either as a member of the researched community or a distant observer (Nakata 2015, Jimenez *et al*. 2021).

Insider researchers are those who share a history and cultural ways of being with the participants. They might be community members, or they place themselves closely into their research context and create a friendly relationship with the participants (Kanuha 2000, Adu-Ampong and Adams 2020). Outsider researchers are usually not members of the participants' community. They observe the research context and the participants' behaviour from a distance to avoid any interruption to the research context. Such definitions of insider and outsider positionalities separate the research participants from the researcher (Naples 1996, Jimenez *et al*. 2021) and constitute researchers as sole producers of knowledge and place them in a higher position than the participants. Yet, researchers and participants supplement each other through the research processes (Delph-Janiurek 2001), including constructing researchers' positionalities. While a researcher's agency allows him/her to decide strategies to place themselves in the desired position to ensure the best observation (Adelman *et al*. 1976, Measor and Woods 1984, Berger 2015, Milligan 2016, Barnes 2021), participants can act as agents to control a researcher's access and engagement in the community as an insider or outsider or anywhere between these two ends.

The 'insider'/'outsider' fixed dichotomy is opposed by many scholars who propose a notion of 'fluid identity that is developed differently in different situations (Hellawell 2006, Thomson and Gunter 2011, McGinity 2012, Milligan 2016, Barnes 2021). Researchers are often 'inbetweeners', where they experience multiple and shifting identities (Mullings 1999, Srivastava 2006).

However, Milligan (2016) opposed the notion of 'fluidity' by viewing the researcher as an active agent in the field who actively negotiates her positions during data collection and continuously and consciously moves between the 'insider' and 'outsider' status. Barnes (2021) goes further by blending the notions of 'fluid' and 'active' in-betweenness and calling himself a 'liquid inbetweener' where he

was more concerned with locating, defining and understanding his positionality than dictating it (Barnes 2021, p. 248). He used his agency to understand his positionalities and their effect on his understanding rather than placing himself in a specific position.

Nonetheless, the existing discussions in this area are concerned about the researchers' perspectives and hence, I argue, reductionist. Most of the narratives in this area examine how a researcher determines his/her position. While researchers are active agents, I argue that participants' agencies also contribute to the researchers' positionalities. Among very few scholars, Milligan (2016) acknowledged the contribution of her participants in shaping her positionality 'much of my identity in this cross-cultural ethnographic research was given to me by the wider community, who saw me as the mzungu' (p. 248). Yet, she did not explicitly discuss the participants' role in developing and changing her positionalities. Rather, her discussion focused on the researcher's active choices and how these affect the way the researcher was viewed.

Although I acknowledge Milligan's (2016) proposition and consider myself as an active agent in developing my positionalities, I argue that the social structure – the internal relations between social positions e.g. researcher and participants (Kaidesoja 2009) – and participants' actions and responses are no less responsible for determining positionalities (Arthur 2010). As I take a Critical Realist (CR) ontological standpoint, I argue that in my deliberation to secure a suitable position (researcher agency), the social norms and values and the participants agency need to be reflected to understand my positionalities and their effect on the data. The CR framework seeks to account for how agents use their personal powers for the desired outcome in any given social situation (Archer and Archer 2003). The power of an individual member of society may be commissioned by several social factors such as social capital (e.g. the network with other members) (Bourdieu 1990), cultural values (e.g. construction of gender), interpersonal skills and so on.

This paper argues that positionalities are co-constructed by researcher and participant through complex interactions between researchers' and participants' perceptions and agency. The concept of co-construction here refers to a linguistic and interactional process that mediates a newcomer's (researcher in this case) participation and identity formation in a new cultural context (Duff 2002).

In this paper, with empirical data I explained my own positionality and discuss.

- how the interactions between the participants and my agency contributed to the co-construction of my positionalities
- how different positionalities directed my accessibility in the field and influenced my data
- how I used my agency to minimize the effect of my positionalities on the research environment

Conceptual frameworks

Two different conceptual frameworks are brought together in this paper. First, a researcher's positionality during qualitative fieldwork is understood as action and negotiation rather than a static status of the researcher (Cho and Yi 2019). A researcher continuously negotiates and shifts his/her identities in the field. The positionality is fluid and may range from a complete outsider to a native status and anywhere between these two poles.

Second, positionality is considered as a social event (i.e. the action and negotiation) which is looked at through a Critical Realist (Bhaskar 2013) lens. A Critical Realist (CR) approach suggests that any social phenomenon (e.g. positionality) needs to be analyzed, taking the agency-structure relationship into account (Scott 2005, Pawson 2013, Tikly 2015). It acknowledges the existence of a mind-independent, structured and changing reality. But the knowledge of reality is a social product, which is not independent of those who produce it (Bhaskar 2013). According to CR philosophy, social structure and human agency possess distinct power in their own right. The social structure includes the features (e.g. norms, culture) of the society, while human agency possesses attributes such as self-consciousness, reflexivity, intentionality and emotionality (Tikly 2015,

Palaganas *et al.* 2017). While the powers of social structures enable or restrict human actions, human agency enables people to formulate, pursue interests and learn. For instance, the power of cultural values, such as social constructions of 'gender', may shape how people of different gender identities interact. At the same time, the agencies of an individual member of society may allow them to interact in their desired way despite the cultural norms.

In this study, the social norms and values of the research context, such as the social construction of gender, and the cultural characteristics of the society (e.g. social cohesion, sense of hierarchy etc.) are considered as elements of social structure in which both the participants and I used our agencies to act. The complex interactions between the social structure and our agencies (Archer and Archer 2003) shaped my identities and positionalities in the field.

The positionalities in my fieldwork

My experiences can be broadly categorized into four distinctive but overlapping sequential positions. The following sections describe how the positionalities were constructed and navigated as well as how those impacted my data and understanding of the context. To do so, I primarily focus on the interview data collected from a male and a female participant so that the gender aspect can be discussed because gender is an element of social structure and contributes to the internal relations between social positions (Kaidesoja 2009).

As a male researcher, I could interact less with the female teacher than with the male one. I spent time with the male teacher outside school hours. This was not possible with the female teachers as they had to go home as soon as the school hours finished to take care of family and children. I felt my positionality changed over time but differently for these two teachers due to the different social relationships.

A. *Insider to researcher, outsider to Participants*

On a lovely Asian winter morning, I appeared at the chosen school in rural Bangladesh with all my wisdom about in-depth qualitative research acquired from hundreds of pages of theoretical reading about the insider/outsider dichotomy and inbetweener status. I was confident that as an insider, I would be able to access the community very quickly. At the same time, I was also prepared to minimize the drawbacks of being a native researcher, such as missing out on small but significant events (Bonner and Tolhurst 2002).

However, the first sentence from a participant after introducing the research topic crushed my confidence and piled uncertainty. The response from the male participant was:

> People do research sitting in an air-conditioned room, how they can understand how we suffer here in school and how the research can improve our life!

The more responses I received during the first meeting, the more I realized how naïvely I had misunderstood the dynamics of positionalities. Teachers appeared to be reluctant to talk about their collaborative interactions. The male teacher said:

> We do not have any time to collaborate or discuss together … you see, we need to do all sorts of tasks, such as census, vaccination campaign, preparing voter list … .

Time has been mentioned as the most salient barrier to any change in schools (Fullan and Miles 1992). The meaning of 'we do not have time' has several dimensions (Collinson and Cook 2001), which might have been discussed following this response. However, the respondent did not show any intention to discuss this further; rather, he grabbed his student register book and went out of the staff room for his class. I received similar short responses from the female teacher at that point. For instance, she said,

> … we have a very good relationship among the colleagues, but we do not have time for collaborative learning … .

Relationships between colleagues can be sensitive and might not be revealed to a stranger. Moreover, a researcher from the UK probably was perceived as someone with higher social status, which may have contributed to the power imbalance and resulted in such superficial responses.

In contrast to Milligan's experience, as she felt like an insider (after she engaged her participants in participative research) in a different cultural context, I discovered myself as an outsider in my very familiar home! However, I was also thrilled to find myself in such a position and started observing the relationship between my positionality and the data I collected. As a result, I went backwards and took time to access the community.

I tried to do so by emphasizing myself as someone who was born, brought up, educated and lived most of his life in a similar context as theirs. I stressed my professional identity as an educator and someone who had previously worked with teachers as a part of a project they participated in to minimize participants' perceived power gap (Vass 2017).

To make a good rapport, I spoke in their local dialect (which I learnt from some of my university fellows who were from the same district), participated in teachers' social activities outside of the school (Figure 1), and put on local dress (e.g. Punjabi, Fotua which are traditional men's tops), spend time in tea stalls after school hours and helped some of them to learn using internet on their smartphones. Through these actions, I was trying to show that I was not an exploitative interloper (Gerrish 1997, Hammersley 2006).

B. *Insider to participants, an outsider to researcher*

Eventually, over the next couple of weeks, the participants started to gossip, laugh and use slang in front of me. They pulled me into their collegial chitchat and treated me as their friend. However, I was experiencing teachers' practices unfamiliar to me because I had no prior experience with these dimensions of teachers' working lives. For instance, I found that teachers were teamed in pairs to share a class in two different sections, which is not a ubiquitous case in Bangladeshi primary schools because of staff shortages in this school. It was an interesting aspect of my research, so I talked about that with the teachers. When I asked about the process of sharing lessons, the male said,

Figure 1. I attended a night-long local folk festival with some of my participants.

… the headteacher assigns two teachers for two different sections of the same class at the beginning of the academic year. We conduct the same lesson in a week in different sections … .

As I reflected on this response in the night, I thought the teacher could have explained how they prepared the lesson together, whether and how they shared teaching materials etc. He did not do so because he probably assumed I knew how these are done since I was from a similar context. Bernstein's (1964) language codes, well-used discourses in teacher professionalism and organizational culture studies (Walford 2011), were helpful in understanding teachers' above responses. Bernstein called such responses 'restricted code', which needs the listener/reader to explore further by prompt questions or additional investigations. The 'restricted code' might be a result of two aspects. First, I kept perceiving myself as an outsider after the first meeting experience. Second, as teachers started to consider me an insider, they started using their colloquial language, which often appeared strange to me.

However, my relationship with the female teacher was not changed much at this stage. I had little interaction with her during school time and no communication after school hours. The female teachers were interested in my family's lives in England. I shared my experience of living in England during break time with them.

Hence, I felt that I needed to make distance from the male teachers to make my outsiderness apparent to them by reminding them of my researcher (not a teacher) role and asking more prompt questions. Gerrish (1997) suggested that being open, suspending assumptions and avoiding over-rapport are the strategies that help reduce the influence of the researcher's presence on the context. By 'being open', he meant being explicit about the role of the researcher. So, I attempted to emphasize my researcher identity by wearing a formal dress and explaining my role during the fieldwork. I also indicated that I did not have much experience as a teacher. These strategies helped the participants and me to understand and acknowledge my outsiderness.

C. *Sympathized outsider*

My behaviours described in the previous section made the teachers more explicit in their responses. For instance, the male teacher claimed that the teacher guide, provided by the government, had lessened their professional discussion with colleagues as all the instructions about the methods and techniques for each lesson were there. When he said that, they brought the guide and showed examples of how it confined them to fixed pedagogies. He also acknowledged that I might not be aware of the teacher guide. He said,

> There are many things, and I discussed some of those earlier. You know … shortage of time … lack of resources … also some government efforts … For instance, the teachers' guide … Oh, you probably do not know that we have been given a teachers' guide from the DPE … (then brought the guide and explained the purpose and contents).

Such responses can be called 'elaborated codes' (Bernstein 1964), allowing me to read between the lines with the least number of prompt questions. Moreover, I could feel their sympathy for my outsiderness when he stopped between sentences and said, 'Oh, you probably do not know … '. Such a sympathized outsiderness offered me access to the community and explicitness in the responses.

As the male teacher understood my outsiderness and became explicit in his responses, the female teacher started to trust me. She started to talk about her relationships with different colleagues. At the same time, she explained the aspects from a gender perspective as she understood that as a male researcher, I might not realize the issue of a female teacher. For example, I asked a female teacher whom she talks to least.

> She said: *Shorafot sir because he is a cousin of my husband …*

She spent several minutes explaining how a woman respects her husband's cousins, why she should avoid arguments with him, and how closely knitted Bangladeshi rural society is. While

such a response was helpful, it seemed like a mechanical process. I asked the participants any new questions raised from the previous discussion, and they tried to explain as much as possible. But I felt that the construction of knowledge was still a one-way process; I wanted a harmonious relationship where we all learn together.

D. *Harmonious positionality*

As time went by, the relationship became more harmonious. The participants took me to social and cultural events, invited me to their houses, and 'I felt I no longer had to think of a series of questions to encourage participants to elaborate on issues I needed to understand. The learning process was happening spontaneously. Both the participants and I started to see events using similar lenses. At this stage, the interactions between the participants and me were more like discussions and dialogue that were embedded in day-to-day conversation rather than interviews. During such discussions, the participants acknowledged my researcher's positionalities. They understood my research questions and pointed out any examples that may help me answer my research questions in our natural conversations. For instance, there was a discussion about land price hikes in Bangladesh in a tea-stall conversation among local primary teachers (from different schools). After the conversation, the male teacher said:

> Oh, I forgot to mention one thing. We have a cooperative society, and four of our colleagues are members. We deposited money together to buy a plot of land together. I think this can be an example of collaboration for your study.

I was taken as a member of their meetings, distributed in different groups during group work, asked for an opinion on their decision-making process, invited to their social and family programmes, and spoke slang without hesitation in front of me! I was careful in getting involved in their professional decision-making since I did not want to influence their habitual activities. Yet, I could see that my presence was not altering their activities, and the inner dimension of their collaboration was becoming more apparent to me as a member of their community. The learning in this situation was both ways.

Moreover, conversations between the participants (both male and female) and I became more unstructured than before. I often did not need to look at my interview agenda; discussions were followed naturally. For instance, after a government official visited the school, I asked the teachers how much they thought the inspector's visits were helpful. The male teacher mentioned the school community as a 'family' where he included me. Other teachers (including the female teachers) joined and participated in the discussion. The conversation was:

> Shorafot Hossain: Let's think that we are in a family; we have a very simple lunch like rice with mashed potato and lentils. We will manage with that. But if a guest comes, we will try to arrange something special, at least scrambled egg … or some sort of fish … . … that's how we will treat him (the guest) … our lessons are similar … we teach in our own way. But if there someone comes to observe, naturally we …
>
> Benu Akter: At least fry an egg … (Laughter)
>
> Sonu Shaha: We fill our stomachs anyway …
>
> Shorafot Hossain: But you have just become a part of our family, we share the typical lunch with you, so you can see the real lesson we conduct … but if you come all of a sudden (like a government inspector) … You won't see the regular practice …
>
> Me: I came to taste the mashed potato and lentils (laugh)

Indeed, I felt like a family member in the school towards the end of my fieldwork. This relationship provided me with a culturally rich understanding of the data I collected. I was able to develop a longer-term friendship with the participants and I still have frequent communication with them. However, such a position was not possible to achieve by only the researcher's endeavour.

Interactions between the participants' views of a researcher and my perception of my positionalities evolved into such positions. Yet, I had to maintain several strategies to influence the participants' views to ensure a deeper understanding of the context. The experiences of the positionalities can be summarized by Figure 2.

The diagram above resembles very distinctive but overlapping positionalities. The first circle represents a situation where the researcher perceived himself as an insider, but participants considered him an outsider. In the second one (clockwise), the participants considered the researcher an insider, but the researcher found the context strange. Third, both participants and the researcher acknowledged the limitation of knowledge of the researcher about the context and the participants are sympathized to the outsiderness of the researcher. And finally, a harmonious relationship where both researcher and participants are sympathetic to each other. The positionalities overlap and continuously shift (Naples 1996, Nakata 2015, Milligan 2016, Barnes 2021). I was never a complete insider or a complete outsider but an inbetweener. However, my positionality was not liquid (Thomson & Gunter 2011, Barnes 2021) as I deliberately changed my position. Hence, I found my experience more aligned with Milligan's, an active inbetweener. However, my positionality was not determined only by my agency but also by how my participants saw me.

Hence, I argue that to obtain an authentic understanding of the context, a researcher needs to navigate through the different positionalities by being reflexive on his/her strategies and the data collected and on the participants' agency. I acknowledge that a specific positionality may not be useful (and possible) for all research. Thus, how a position impacts, the data collection and interpretation needs to be reflected on and documented (Hammersley 2006). How my positions impacted
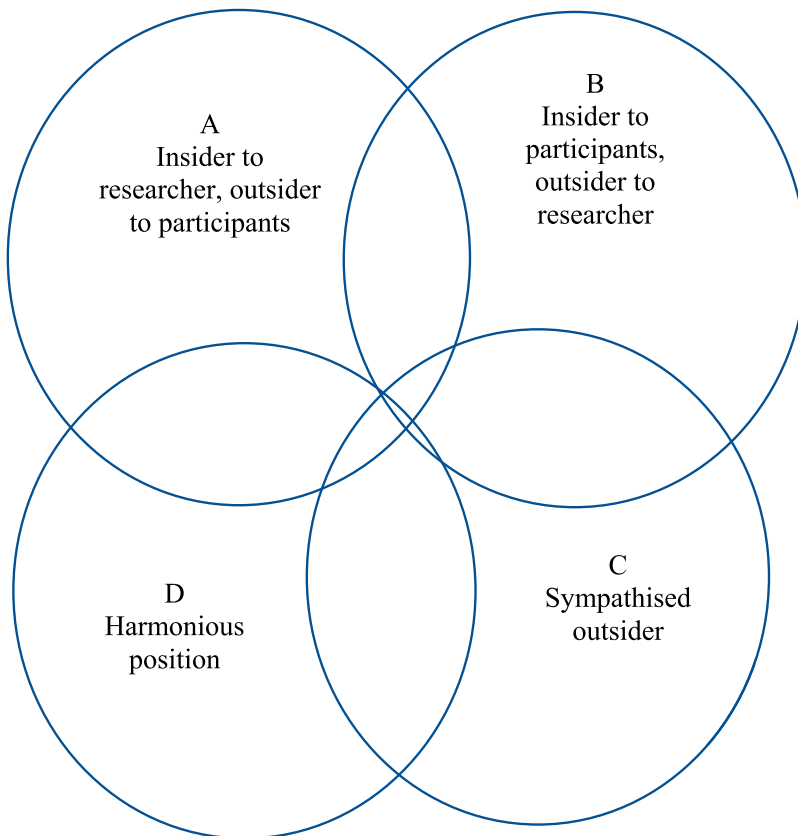

Figure 2. Co-constructing positionality.

Table 1. Positionalities and their effects on data.

A. Insider to researcher, outsider to participants		B. Insider to Participants, outsider to researcher	
Effect on data	*Strategy to reduce effect*	*Effect on data*	*Strategy to reduce effect*
• Limited access to the community	• Responses include contextual jargon	• Responses include contextual jargon	• Reminding the participants about researcher role
• Teachers' reluctance to talk	• The context becomes hazy	• Participants became implicit in their responses	• More prompt questions
• Superficial response	• I required more prompt questions		
• Skipping main point of the discussion			
C. Both parties acknowledge researcher's outsiders		**D. Harmonious Position**	
Effect on data	*Strategy to reduce effect*	*Effect on data*	*Strategy to reduce effect*
• Responses discussed trifle matters but in detail	• Spending time outside of research context	• Explicate and spontaneous response	• Reflexivity[a]
• Longer responses	• Sharing experience of different context	• Sensitive information	
• Artifacts shown by the participants		• Both way learning	
• One way flow of information			

[a]Reflexivity is a strategy that is maintained in each position. However, for the 'Harmonious position' this has been the most significant tool to maintain an appropriate relationship and ensure the required standard of data.

data, and the strategies I adopted to navigate different positions are described above. Table 1 reflects the diagram above and summarizes the discussion.

Conclusion

In this paper, I argued that the researcher's positionalities are products of a complex interaction of agencies of the researcher and participants. While this proposition acknowledges the contemporary argument for an inbetweener position (Milligan 2016, Barnes 2021, Jimenez *et al*. 2021) and discards the idea of insider/outsider dichotomy, it argues that an inbetweener position is neither a result of the field context (Thomson and Gunter 2011, Barnes 2021) nor solely the agency of the researcher (Milligan 2016, Jimenez *et al*. 2021) but a combination of both. This means that a researcher's positionality is not just a fluctuating and permeable social location due to only the continuously evolving nature of his/her professional identity (Barnes 2021) or just the researcher's actively navigated situation. As I experienced during my fieldwork, positionality is a perceptual construction of identity shaped by the interactions between researcher's and participants' perception of the researcher, their agency and the social structure.

In this paper, I discussed how I adopted several strategies to negotiate my positionalities and how participants' perceptions of a researcher and their agency and the social norms and values contributed to my continuously changing positionalities. I also reflected on how different positionalities impacted the data I collected. For instance, during my fieldwork, I encountered four distinguished but overlapped positionalities: the different combinations of my perceived identities by myself and the participants. The combinations are; insider to the researcher but an outsider to the participants, insider to participants but an outsider to the researcher, the outsiderness of the researcher acknowledged by both parties, and a harmonious positionality.

A Critical Realist (Scott 2005, Bhaskar 2013) philosophy helped conceptualize the construction of the researcher's positionality. According to a CR theory, there is an independent reality which cannot

be observed, but the unobservable structures cause observable events and social relations. The social world is layered, complex and an open system. The different entities (e.g. people such as teachers, organizations/groupings such as the Cooperative, policies, plans, goals etc.) have properties that support mechanisms which can enable, constrain or block mechanisms of other entities. For my research, many of these mechanisms were latent but were activated by personal power (such as my actions or those of the participants) or by the power of social structures over personal actions (e.g. with gender).

For instance, my positionalities were different for different people simultaneously. I acknowledge that gender, along with other cultural dimensions, is one of the most significant factors shaping my positionalities. With the same strategy I adopted to access the teachers' community, I had different accessibilities to a male and a female participant. This was not due to a mere individual characteristic of the participants, but the social construction of gender roles was responsible for such difference. Hence, I argue that the researcher's and participants' agency and the social structure affect the positionality of a researcher.

Therefore, the current practice in graduate training, e.g. PhD, may reconsider the definition and development of researchers' positionality. While the current narratives in this area discuss the role of reflexivity in developing positionalities, these most encompass the researcher's agency. The participants' role and the context's social structure must be considered in such discussions.

I acknowledge that a single positionality may not be sufficient to obtain the required amount and standard of data for different research and thus appreciate all the positionalities. A careful scrutinization of different positionalities and their respective effect on the data and analysis should be reported (Hammersley 2006).
