ABSTRACT

Background

Adolescent overweight and obesity has increased globally, and can be associated with short- and long-term health consequences. Modifying known dietary and behavioural risk factors through behaviour changing interventions (BCI) may help to reduce childhood overweight and obesity. This is an update of a review published in 2009.

Objectives

To assess the effects of diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years.

Search methods

We performed a systematic literature search in: CENTRAL, MEDLINE, Embase, PsycINFO, CINAHL, LILACS, and the trial registers ClinicalTrials.gov and ICTRP Search Portal. We checked references of identified studies and systematic reviews. There were no language restrictions. The date of the last search was July 2016 for all databases.

Selection criteria

We selected randomised controlled trials (RCTs) of diet, physical activity and behavioural interventions for treating overweight or obesity in adolescents aged 12 to 17 years.

Data collection and analysis

Two review authors independently assessed risk of bias, evaluated the overall quality of the evidence using the GRADE instrument and extracted data following the guidelines of the *Cochrane Handbook for Systematic Reviews of Interventions*. We contacted trial authors for additional information.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) I Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Main results

We included 44 completed RCTs (4781 participants) and 50 ongoing studies. The number of participants in each trial varied (10 to 521) as did the length of follow-up (6 to 24 months). Participants ages ranged from 12 to 17.5 years in all trials that reported mean age at baseline. Most of the trials used a multidisciplinary intervention with a combination of diet, physical activity and behavioural components. The content and duration of the intervention, its delivery and the comparators varied across trials. The studies contributing most information to outcomes of weight and body mass index (BMI) were from studies at a low risk of bias, but studies with a high risk of bias provided data on adverse events and quality of life.

The mean difference (MD) of the change in BMI at the longest follow-up period in favour of BCI was -1.18 kg/m² (95% confidence interval (CI) -1.67 to -0.69); 2774 participants; 28 trials; low quality evidence. BCI lowered the change in BMI z score by -0.13 units (95% CI -0.21 to -0.05); 2399 participants; 20 trials; low quality evidence. BCI lowered body weight by -3.67 kg (95% CI -5.21 to - 2.13); 1993 participants; 20 trials; moderate quality evidence. The effect on weight measures persisted in trials with 18 to 24 months' follow-up for both BMI (MD -1.49 kg/m² (95% CI -2.56 to -0.41); 760 participants; 6 trials and BMI z score MD -0.34 (95% CI - 0.66 to -0.02); 602 participants; 5 trials).

There were subgroup differences showing larger effects for both BMI and BMI z score in studies comparing interventions with no intervention/wait list control or usual care, compared with those testing concomitant interventions delivered to both the intervention and control group. There were no subgroup differences between interventions with and without parental involvement or by intervention type or setting (health care, community, school) or mode of delivery (individual versus group).

The rate of adverse events in intervention and control groups was unclear with only five trials reporting harms, and of these, details were provided in only one (low quality evidence). None of the included studies reported on all-cause mortality, morbidity or socioeconomic effects.

BCIs at the longest follow-up moderately improved adolescent's health-related quality of life (standardised mean difference 0.44 ((95% CI 0.09 to 0.79); P = 0.01; 972 participants; 7 trials; 8 comparisons; low quality of evidence) but not self-esteem.

Trials were inconsistent in how they measured dietary intake, dietary behaviours, physical activity and behaviour.

Authors' conclusions

We found low quality evidence that multidisciplinary interventions involving a combination of diet, physical activity and behavioural components reduce measures of BMI and moderate quality evidence that they reduce weight in overweight or obese adolescents, mainly when compared with no treatment or waiting list controls. Inconsistent results, risk of bias or indirectness of outcome measures used mean that the evidence should be interpreted with caution. We have identified a large number of ongoing trials (50) which we will include in future updates of this review.

PLAIN LANGUAGE SUMMARY

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years

Review question

How effective are diet, physical activity and behavioural interventions in reducing the weight of overweight or obese adolescents aged 12 to 17 years?

Background

Across the world, more adolescents are becoming overweight and obese. These adolescents are more likely to suffer from health problems in later life. More information is needed about what works best in treating this problem.

Study characteristics

We found 44 randomised controlled trials (clinical studies where people are randomly put into one of two or more treatment groups) comparing diet, physical activity and behavioural (where habits are changed or improved) treatments (interventions) to a variety of control groups delivered to 4781 overweight or obese adolescents aged 12 to 17 years. Our systematic review reports on the effects of multidisciplinary interventions, dietary interventions and physical activity interventions compared with a control group (no

intervention, 'usual care,' enhanced usual care or some other therapy if it was also delivered to the intervention group). The adolescents in the included studies were monitored (called follow-up) for between six months and two years.

Key results

The average age of adolescents ranged from 12 to 17.5 years. Most studies reported the body mass index (BMI). BMI is a measure of body fat and is calculated by dividing weight (in kilograms) by the square of the body height measured in metres (kg/m²). We summarised the results of 28 studies in 2774 adolescents reporting BMI, which on average was 1.18 kg/m² lower in the intervention groups compared with the control groups. We summarised the results of 20 studies in 1993 adolescents reporting weight, which on average was 3.67 kg lower in the intervention groups compared with the control groups. BMI reduction was maintained at 18 to 24 months of follow-up (monitoring participants until the end of the study), which on average was 1.49 kg/m² lower in the intervention groups compared with their life and health) but we did not find firm evidence of an advantage or disadvantage of these interventions for improving self-esteem, physical activity and food intake. No study reported on death from any cause, morbidity (illnesses) or socioeconomic effects (such as days away from school). Three studies reported no side effects, one reported no serious side effects, one did not provide details of side effects and the rest of the studies did not report whether side effects occurred or not.

We identified 50 ongoing studies which we will include in future updates of our review.

Currentness of evidence

This evidence is up to date as of July 2016.

Quality of the evidence

The overall quality of the evidence was rated as low for most of the outcomes (results) measured, mainly because of limited confidence in how studies were performed, inconsistent results between the studies and the way that some outcomes used do not capture obesity outcomes directly. Also, there were just a few studies for some outcomes, with small numbers of included adolescents.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 3 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

SUMMARY OF FINDINGS FOR THE MAIN COMPARISON [Explanation]

Diet, physical activity and behavioural interventions for the treatment of overweight or obesity in adolescents aged 12-17 years

Patient or population: adolescents (aged 12-17 years) being overweight or obese

Settings: school; community; healthcare

Intervention: behaviour changing interventions (behavioural, diet, physical activity (or a combination) components)

Comparison: usual care; concomitant therapy; no intervention/wait list

Outcomes	Assumed risk	Corresponding risk	Relative effect	No of participants	Quality of the evidence	Comments
	Usual care, concomi- tant therapy, no inter- vention/wait list		(95% CI)	(trials)	(GRADE)	
 b) Change in BMI z score^d Follow-up: 6-24 months c) Change in weight 	change ranged across control groups from -1. 18 kg/m ² to 2.1 kg/m ² b) The mean BMI z score change ranged across control groups from -0.31 units to 0.13 units c) The mean change in weight ranged across	vention groups was 1. 18 kg/m² lower (1.67 lower to 0.69 lower) b) The mean BMI z score change in the in- tervention groups was 0.13 units lower (0.21	-	a) 2774 (28) b) 2399 (20) c) 1993 (20)	a) ⊕⊕○○ Low ^a b) ⊕⊕○○ Low ^b C) ⊕⊕⊕○ Moderate ^c	 a) Lower BMI indicates weight loss b) Lower score indicates weight loss c) Lower weight indicates weight loss

^{*c*}Downgraded one level due to inconsistency ($I^2 = 96\%$); see Appendix 9.

d"A BMI z score or standard deviation score indicates how many units (of the standard deviation) a child's BMI is above or below the average BMI value for their age group and sex. For instance, a z score of 1.5 indicates that a child is 1.5 standard deviations above the average value, and a z score of -1.5 indicates a child is 1.5 standard deviations below the average value." (NOO NHS 2011).

^eDowngraded one level due to reporting and other bias and limited information (small number of studies and the majority of trials had less than 80% of participants enrolled included in the analysis); see Appendix 9.

ы

f Downgraded one level due to reporting and detection bias (no blinding of participants and personnel) and inconsistency (I² = 85%); see Appendix 9). s A broadly accurate guide of how to interpret the standard mean difference (SMD) is: less than 0.40 = small, 0.40 to 0.70 = moderate, greater than 0.70 = large (Higgins 2011a).

BACKGROUND

The prevalence of overweight and obese children and adolescents has increased throughout the world, presenting a global public health crisis (Ng 2014; WHO 2015a). Although once considered to be a condition affecting only high-income countries, rates of paediatric overweight and obesity have started to rise dramatically in some low- to middle-income countries (Wang 2012). Using the International Obesity Task Force (IOTF) standard definition, the age-standardised prevalence of overweight and obesity in children and adolescents has increased in both high-income and lowto middle-income countries since the mid-1980s (Cole 2000). In 2013, the prevalence of overweight and obese children and adolescents in high-income countries was estimated at 23.8% (95% confidence interval (CI) 22.9 to 24.7) for boys and 22.6% (95% CI 21.7 to 23.6) for girls. In low- to middle-income countries, the prevalence was estimated as 12.9% (95% CI 12.3 to 13.5) for boys and 13.4% (95% CI 13.0 to 13.9) for girls (Ng 2014). Very young children are also affected. In 2010, de Onis 2010 used the World Health Organization (WHO) growth standards (WHO 2015b) to estimate that over 42 million children under five years of age were overweight or obese, with approximately 35 million of these children living in low- to middle-income countries.

Inequalities in overweight and obesity prevalence have also been documented. Generally, socioeconomically disadvantaged children in high-income countries (Knai 2012; Shrewsbury 2008), and children of higher socioeconomic status in low- to middle-income countries (Lobstein 2004; Wang 2012) are at greater risk of becoming overweight. However, this relationship may vary by population demographics (e.g. age, gender, ethnicity), and environment (e.g. country, urbanisation) (Wang 2012). The prevalence of obesity varies by ethnicity, with large data sets showing substantial ethnic variation in English (HSCIC 2015), US (Freedman 2006; Skinner 2014), and New Zealand (Rajput 2014) child populations.

While there is some evidence that the rate of increase in paediatric obesity may be slowing in some high-income countries, current levels remain too high, and continue to rise in many lowto middle-income countries (Olds 2011; Rokholm 2010). However, an additional concern in some high-income countries such as the USA (Kelly 2013; Skinner 2014), and England (CMO 2015; Ells 2015), is the rise in severe paediatric obesity. While the IOTF published an international definition for severe paediatric (morbid) obesity in 2012 (Cole 2012), often severe obesity prevalence is reported using country-specific cut-off points making international comparisons difficult. However, data from the USA (Skinner 2014), and England (Ells 2015), have shown that the prevalence of severe paediatric obesity varies by socioeconomic status and ethnicity, and may result in a greater risk of adverse cardiometabolic events and severe obesity in adulthood (Kelly 2013).

Description of the condition

Childhood overweight and obesity results from an accumulation of excess body fat, and can increase the risk of both short- and longer-term health consequences. Numerous obesity-related co morbidities can develop during childhood, which include muscular skeletal complaints (Paulis 2014); cardiovascular risk factors such as hypertension, insulin resistance and hyperlipidaemia (Reilly 2003), even in very young children (Bocca 2013); and conditions such as such as sleep apnoea (Narang 2012), asthma (Egan 2013), liver disease, and type 2 diabetes mellitus (Daniels 2009; Lobstein 2004). The condition can also affect psychosocial well-being, with obese young people susceptible to reduced self-esteem and health-related quality of life (Griffiths 2010), and stigmatisation (Puhl 2007; Tang-Peronard 2008). Evidence also shows that childhood obesity can track into adulthood (Parsons 1999; Singh 2008; Whitaker 1997), and is therefore associated with an increased risk of ill health later in life (Reilly 2003).

Description of the intervention

Given the serious implications associated with childhood and adolescent obesity, effective treatment is imperative. While the fundamental principles of weight management in children and adolescents are the same as in adults (i.e. reduced energy intake and increased energy expenditure), the primary aim of treatment (i.e. weight reduction or deceleration of weight gain) and the most suitable intervention approach vary, and are dependent on the child's age and degree of excess weight, among other considerations. Behaviour changing interventions combining dietary, physical activity and behavioural components are effective and are considered the current best practice in the treatment of childhood obesity in adolescents under 18 years of age (WHO 2015c).

Adverse effects of the intervention

It is not anticipated that diet, physical activity and behavioural interventions will lead to adverse outcomes. However, as with all obesity treatment interventions in children and young people, potential adverse effects should be considered, including effects on linear growth, eating disorders and psychological well-being.

How the intervention might work

The cause of childhood obesity is multifactorial, including dietary, activity, behavioural and environmental factors (Orsi 2011). Modifying these factors by behaviour changing interventions is considered the line of treatment of childhood overweight and obesity (Spear 2007). Behaviour changing interventions aim to improve dietary intake, increase activity levels, reduce sedentary behaviour, provide techniques to sustain healthy lifestyle and may have parental or family involvement (Kothandan 2014). Interventions may target one behavioural component (diet only or physical

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 7 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. activity only) while other interventions integrate several components (diet, physical activity and behavioural modification) that seem to show promising results in decreasing overweight and obesity in adolescents (Jelalian 1999). Behavioural modification is often based on theoretical elements such as cognitive behavioural theory to help adolescents sustain changes and minimise relapse (Doak 2006). Theory-based interventions address different elements such as healthy food choices, environmental control, positive thinking and goal-setting that appear to be linked to positive weight outcomes (Dewar 2013; MacDonell 2010; White 2004). Earlier systematic reviews showed that behaviour changing interventions improved weight reduction in children aged 19 and younger (Ho 2012; Wilfley 2007), while one systematic review by Kelly and colleagues showed that interventions addressing nutrition, physical activity and behavioural skills with parental involvement appears to be an effective way to reduce adolescent obesity (Kelly 2008). One systematic review by Ruotsalainen and colleagues showed that supervised physical activity interventions have a favourable effect on adolescent BMI. Ruotsalainen acknowledged the importance of complex interventions that involve behavioural modification and management in the implementation of physical activity in adolescents (Ruotsalainen 2015), while the effect of dietary interventions remains unclear. One systematic review by Collins and colleagues found inconsistent evidence on the role of dietetic interventions in the treatment of childhood obesity (Collins 2006). However, the length, delivery setting and long-term effect of behaviour changing interventions in the treatment of adolescent obesity remains unclear (Ho 2012; McGovern 2008; Wilfley 2007). The importance of behaviour changing interventions in treating childhood obesity has led to questioning their effectiveness in adolescents and whether different types of behavioural modification are more effective than others.

Why it is important to do this review

The first version of this systematic review was published in 2003 and included analysis of childhood obesity treatment trials published up to July 2001 (Summerbell 2003). The second version was published in 2009 providing an update to the 2003 review (Oude Luttikhuis 2009). To reflect the rapid growth in this field, the third update to this review has been split across six reviews focusing on the following treatment approaches: surgery; drugs; parent-only interventions; diet, physical activity and behavioural interventions for young children aged 0 to 6 years; school children aged 5 to 11 years and adolescents aged 12 to 17 years. The current review examines the effectiveness of interventions for adolescents aged 12 to 17 years. Previous systematic reviews identified gaps in research assessing interventions specifically for this age group (Doak 2006). Other systematic reviews did not focus on adolescents specifically (Ho 2012; Peirson 2015; Wilfley 2007) or focused on specific interventions (Ruotsalainen 2015). This review has extended the evidence base by including trials of any form of behaviour changing intervention aimed to treat obesity in adolescents aged 12 to 17 years. It also includes the effect of behaviour changing interventions on other adiposity indicators (e.g. waist circumference, body fat), behavioural change, quality of life, selfesteem and views of the intervention. The results of this current review and other systematic reviews in this series will provide information on which to underpin clinical guidelines and health policy on the treatment of childhood obesity.

OBJECTIVES

To assess the effects of diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years.

METHODS

Criteria for considering studies for this review

Types of studies

We included randomised controlled clinical trials (RCT). For cross-over trials, we only analysed the first phase before cross-over (if this was six months or more) to avoid the potential of carry over effects. Included studies observed participants for a minimum of six months (this time frame refers to the intervention itself or to a combination of the intervention with a follow-up phase).

Types of participants

We included studies of overweight or obese adolescents with a mean study age of 12 to 17 years at the commencement of the intervention. We excluded studies of critically ill people, pregnant or breastfeeding women, or adolescents with a syndromic cause for their obesity (e.g. Prader-Willi syndrome).

Diagnostic criteria

Any method of overweight or obesity classification was acceptable.

Types of interventions

We planned to investigate the following comparisons of intervention versus control/comparator.

Intervention

Any form of behaviour changing intervention with a primary aim to treat overweight or obesity. Behaviour changing interventions included any form of dietary, physical activity, behavioural therapy, or a combination of these delivered as a single or multicomponent intervention, in any setting, using any delivery method

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 8 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. and included studies which examined weight loss or maintenance or both.

Comparator

No treatment/wait list control, usual care or an alternative concomitant therapy providing it is delivered in the intervention arm. Concomitant interventions had to be the same in the intervention and comparator groups to establish fair comparisons.

Types of outcome measures

Primary outcomes

- Changes in measured BMI or body weight.
- Adverse events.

Secondary outcomes

- Health-related quality of life.
- Self-esteem.
- All-cause mortality.
- Morbidity.
- Anthropometric measures other than BMI.
- Behaviour change.
- Participants' views of the intervention.
- Socioeconomic effects.
- Parenting skill and relationships.

Method and timing of outcome measurement

• Changes in BMI (kg/m²) and body weight (kg): measured at baseline and at least at six months.

• Adverse events: defined as an adverse outcome that occurred during or after the intervention but was not necessarily caused by it, and measured at baseline and at least at six months.

• Health-related quality of life: evaluated by a validated instrument such as Paediatric Quality of Life Inventory and measured at baseline and at least at six months.

• Self-esteem: evaluated by a validated instrument such as Rosenberg Self-Esteem Scale and measured at baseline and at least at six months.

• All-cause mortality: defined as any death that occurred during or after the intervention and measured at six months or later. Morbidity: defined as illness or harm associated with the intervention and measured at baseline and six months or later.

• Anthropometric measures other than change in BMI: defined by validated tools such as waist circumference, skin-fold thickness, waist-to-hip ratio, dual x-ray absorptiometry (DXA) or bioelectrical impedance analysis and measured at baseline and at least at six months.

• Behaviour change: defined as validated measures of diet and physical activity and measured at baseline and at least at six months. Participants' views of the intervention: defined as documented accounts from participant feedback and measured at baseline and at least at six months.

• Parent-child relationship or assessment of parenting: evaluated by a validated instrument and measured at baseline and at least at six months.

• Socioeconomic effects defined as a validated measure of socioeconomic status such as parental income or educational status and measured at baseline and at least at six months.

'Summary of findings' table

We presented a 'Summary of findings' table reporting the following outcomes listed according to priority.

- Changes in BMI and body weight.
- Adverse events.
- Health-related quality of life.
- All-cause mortality.
- Morbidity.
- Socioeconomic effects.

Search methods for identification of studies

Electronic searches

We searched the following sources from inception of each database to 14 July 2016 and placed no restrictions on the language of publication.

• Cochrane Central Register of Controlled Trials (CENTRAL) (2016, Issue 6).

• Epub Ahead of Print, In-Process & Other Non-Indexed Citations, Ovid MEDLINE(R) Daily and Ovid MEDLINE(R) (from 1946).

- Embase Ovid (1974 to 2016 week 28).
- PsycINFO (1806 to July week 1 2016).
- CINAHL.

• LILACS (Latin American and Caribbean Health Science Information database) (last update 8 July 2016).

- ClinicalTrials.gov (www.clinicaltrials.gov).
- WHO International Clinical Trials Registry Platform (ICTRP) (www.who.int/trialsearch/).

We continuously applied a MEDLINE (via OvidSP) e-mail alert service established by the Cochrane Metabolic and Endocrine Disorders Group (CMED) to identify newly published studies using the same search strategy as described for MEDLINE (for details on search strategies and search platforms, see Appendix 1). Should we have identified new studies for inclusion, we planned to evaluate these, incorporated findings in our review and resubmitted another review draft (Beller 2013).

If we detected additional relevant key words during any of the electronic or other searches, we modified the electronic search strategies to incorporate these terms and documented the changes.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 9 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Searching other resources

We tried to identify other potentially eligible trials or ancillary publications by searching the reference lists of retrieved included trials, (systematic) reviews, meta-analyses and health technology assessment reports. We also contacted study authors of included trials to identify any further studies that we may have missed.

Data collection and analysis

Selection of studies

Two review authors (two of LA-K, RJ, EL, JC, KR, CO, LA, EM, LE, HF, JO) independently scanned the abstract, title, or both, of every record retrieved, to determine which studies should be assessed further. We investigated all potentially relevant articles as full text. We resolved any discrepancies through consensus or recourse to a third review author (of KR, EL, LA-K). Where resolution of a disagreement was not possible, we added the article to those 'awaiting assessment' and contacted study authors for clarification. We present an adapted PRISMA flow chart showing the process of study selection (Liberati 2009).

Data extraction and management

For studies that fulfilled the inclusion criteria, two review authors (of LA-K, EL, JC, RJ, CO, LA, EM, KR, HF, RV, MM, JO) independently abstracted key participant and intervention characteristics and reported data on efficacy outcomes and adverse events using standard data extraction templates as supplied by Cochrane Metabolic and Endocrine Disorders Group, with any disagreements to be resolved by discussion, or, if required, by consultation with a third review author (KR or EL) (for details, see Table 1; Appendix 2; Appendix 3; Appendix 4; Appendix 5; Appendix 6; Appendix 7; Appendix 8; Appendix 9; Appendix 10).

We provided information including trial identifier about potentially relevant ongoing studies in the Characteristics of ongoing studies table and in Appendix 5 (Matrix of study endpoints (publications and trial documents)). We tried to find the protocol of each included study and reported primary, secondary and other outcomes in comparison with data in publications in Appendix 5. We e-mailed all authors of included studies to enquire whether they were willing to answer questions regarding their trials. Appendix 10 shows the results of this survey. Thereafter, we sought relevant missing information on the trial from the primary author(s) of the article, if required.

Dealing with duplicate and companion publications

In the event of duplicate publications, companion documents or multiple reports of a primary study, we tried to maximise yield of information by collating all available data and use the most complete data set aggregated across all known publications. In case of doubt, we gave priority to the publication reporting the longest follow-up associated with our primary or secondary outcomes.

Assessment of risk of bias in included studies

We used the Cochrane 'risk of bias' assessment tool (Higgins 2011a; Higgins 2011b), and evaluated the following criteria.

- Random sequence generation (selection bias).
- Allocation concealment (selection bias).
- Imbalances in baseline characteristics.
- Blinding of participants and personnel (performance bias).
- Blinding of outcome assessment (detection bias).
- Incomplete outcome data (attrition bias).
- Selective reporting (reporting bias).
- Other potential sources of bias.

We judged the above 'Risk of bias' criteria as 'low risk', 'high risk' or 'unclear risk' and evaluated individual bias items as described in the *Cochrane Handbook for Systematic Reviews of Interventions* (Higgins 2011a). We present a 'Risk of bias' graph and a 'Risk of bias summary'. We assessed the impact of individual bias domains on study results at endpoint and study levels. In case of high risk of selection bias, all endpoints investigated in the associated study were marked as 'high risk'.

We evaluated whether imbalances in baseline characteristics existed and how these were addressed (Egbewale 2014).

For performance bias (blinding of participants and personnel) and detection bias (blinding of outcome assessors) we evaluated the risk of bias separately for each outcome type (objective and subjective) (Hróbjartsson 2013). We noted whether endpoints were self-reported, investigator-assessed or adjudicated outcome measures. We considered the implications of missing outcome data from individual participants per outcome such as high dropout rates (e.g. above 15%) or disparate attrition rates (e.g. difference of 10% or more between study arms).

We assessed outcome reporting bias by integrating the results of 'Examination of outcome reporting bias' (Kirkham 2010) (Appendix 6), in the 'Matrix of study endpoints (publications and trial documents)' (Appendix 5), and 'Outcomes (outcomes reported in abstract of publication)' section of the Characteristics of included studies table. This analysis formed the basis for the judgement of selective reporting (reporting bias).

We defined the following endpoints as potentially self-reported outcomes.

- Adverse events.
- Health-related quality of life.
- Participant's views of the intervention.
- Changes in body weight.
- Self-esteem.
- Behaviour change.

We defined the following outcomes as potentially investigatorassessed outcomes.

• Changes in BMI and body weight.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 10 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

- Adverse events.
- All-cause mortality.
- Morbidity.

Measures of treatment effect

We expressed dichotomous data as odds ratios (ORs) or risk ratios (RRs) with 95% confidence intervals (CIs). We expressed continuous data as mean differences (MD) if they used the same instruments or standardised mean differences (SMD) if they used different instruments with 95% CI. We expressed time-to-event data as hazard ratios (HRs) with 95% CIs.

We included studies reporting multiple comparison groups in this review. Where this was the case, we considered whether the aim of the trial was to test for differences between these groups, and whether the study authors found a significant difference. Where there were no demonstrated differences, we merged groups as recommended by the *Cochrane Handbook for Systematic Reviews of Interventions* (Section 7.7.8, Higgins 2011a). In studies that found a difference between groups, we used the data for the control group for each intervention group comparison and reduced the weight assigned to the control group by dividing the number of participants in the control group by the number of intervention groups.

Unit of analysis issues

We used data from the first period of cross-over trials if available. We collected data from the latest available time point in the follow-up reported in the studies to avoid double-counting trials in the same analysis. For cluster RCTs, we used the denominator reported in the trial and considered how the analysis methods used took account of the effect of clustering. Due to the small number of cluster RCTs found, we decided not to adjust the data so we performed sensitivity analyses to ascertain if the results were sensitive to the inclusion of studies with a cluster design.

Dealing with missing data

We obtained relevant missing data from study authors, if feasible, and evaluated important numerical data such as screened, eligible, randomised participants as well as intention-to-treat (ITT), astreated and per-protocol populations. We investigated attrition rates (e.g. dropouts, losses to follow-up and withdrawals), and critically appraised issues of missing data and imputation methods (e.g. last observation carried forward (LOCF)).

Where standard deviations (SD) for outcomes were not reported, and we did not receive information from study authors, we imputed these values by assuming the SD of the missing outcome to be the same as the largest SD from those studies where this information was reported. We investigated the impact of imputation on meta-analyses by means of sensitivity analyses. Where papers did not report results as change from baseline, we calculated this and for the SD differences followed the methods presented in the *Cochrane Handbook for Systematic Reviews of Intervention* for imputing these (Section 16.1.3.2, Higgins 2011a), and assumed a correlation of 0.5 between baseline and follow-up measures as suggested by Follmann 1992.

Assessment of heterogeneity

In the event of substantial clinical or methodological heterogeneity, we did not report study results as meta-analytically pooled effect estimates. We identified heterogeneity by visual inspection of forest plots and by using a standard Chi² test with a significance level of $\alpha = 0.1$, in view of the low power of this test. We examined heterogeneity using the I² statistic, which quantifies inconsistency across studies to assess the impact of heterogeneity on the meta-analysis (Higgins 2002; Higgins 2003), where an I² statistic of 75% or more indicates a considerable level of inconsistency (Higgins 2011a).

When we found heterogeneity, we attempted to determine potential reasons for it by examining individual study and subgroup characteristics.

Assessment of reporting biases

If we included 10 studies or more for a given outcome, we used funnel plots to assess small-study effects. Due to several explanations for funnel plot asymmetry, we interpreted results carefully (Sterne 2011).

Data synthesis

Unless there is good evidence for homogeneous effects across studies we primarily summarised low risk of bias data using a randomeffects model (Wood 2008). We interpreted random-effects metaanalyses with due consideration of the whole distribution of effects, ideally by presenting a prediction interval (Higgins 2009). A prediction interval specifies a predicted range for the true treatment effect in an individual study (Riley 2011). In addition, we performed statistical analyses according to the statistical guidelines presented in the *Cochrane Handbook for Systematic Reviews of Interventions* (Higgins 2011a).

Quality of evidence

We presented the overall quality of the evidence for each outcome according to the GRADE approach which takes into account issues related to internal validity (risk of bias, inconsistency, imprecision, publication bias)and also to external validity, such as directness of results. Two review authors (LA-K and KR/EL) rated the quality for each outcome. We presented a summary of the evidence in a Summary of findings for the main comparison, which provides key information about the best estimate of the magnitude of the effect, in relative terms and absolute differences for each relevant comparison of alternative management strategies, numbers of participants and studies addressing each important outcome and the rating of the overall confidence in effect estimates for each

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 11 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. outcome. We created the 'Summary of findings' table based on the methods described in the *Cochrane Handbook for Systematic Reviews of Interventions* (Higgins 2011a). We presented results on the outcomes as described in Types of outcome measures. If metaanalysis was not possible, we presented results in a narrative 'Summary of findings' table.

In addition, we established an appendix 'Checklist to aid consistency and reproducibility of GRADE assessments' (Meader 2014) to help with standardisation of 'Summary of findings' tables (Appendix 9).

Subgroup analysis and investigation of heterogeneity

We expected the following characteristics to introduce clinical heterogeneity, and planned to carry out subgroup analyses with investigation of interactions for our primary outcomes.

- Duration of follow-up.
- Duration of the intervention.
- Duration of postintervention follow-up.
- Type of comparator group.
- Mode of delivery of the intervention.
- Setting.
- Type of intervention.
- Theoretical basis to the intervention.
- Parental involvement.

Sensitivity analysis

We planned to perform sensitivity analyses to explore the influence of the following factors on effect size.

• Restricting the analysis to published studies, and by publication language.

• Restricting the analysis taking into account risk of bias, as specified in the section Assessment of risk of bias in included studies section.

• Restricting the analysis to studies of adolescents without specific health conditions.

• Restricting the analysis to studies with no uncertainties (such as study duration, imputed data).

We also tested the robustness of the results by repeating the analysis using different measures of effect size (RRs, ORs, etc.) and different statistical models (fixed-effect and random-effects models).

RESULTS

Description of studies

For a detailed description of trials, see the Characteristics of included studies, Characteristics of excluded studies, and Characteristics of ongoing studies tables.

Results of the search

This search is up to date as of July 2016 in addition to ongoing email alerts from MEDLINE. The searches generated 16,106 hits after duplicates were removed. Fifty-two additional records were identified through non-database sources. Screening of titles and abstracts identified 736 records to go forward for formal inclusion and exclusion. Forty-four completed RCTs fulfilled the inclusion criteria and were included in the review. For a detailed description of the included trials, see the Characteristics of included studies table. The search identified 50 ongoing trials, which are reported in the Characteristics of ongoing studies table. The flow of trials through the review is presented in Figure 1.

Figure I. Study flow diagram.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 13 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Included studies

A detailed description of the characteristics of included studies is presented elsewhere (see Characteristics of included studies and Appendix 2; Appendix 3; Appendix 4; Appendix 5; Appendix 6; Appendix 7; Appendix 8; Appendix 11). The following is a succinct overview.

Source of data

All data presented in the review were obtained from the published literature. We contacted all study authors for additional information and results are presented in Appendix 10.

Comparisons

To meet the inclusion criteria for the review comparators could be no treatment, usual care or a concomitant therapy providing it was also included in the intervention group. In nine trials the comparator was either no intervention or a wait list control (Brennan 2013; Carraway 2014; Ebbeling 2012; Luna-Pech 2014; Pakpour 2015; Patsopoulou 2017; Schranz 2014; Toulabi 2012; Vos 2011). Twenty-three studies used usual care comparators (Bean 2014; Boodai 2014; Carrel 2005; Christie 2011; Daley 2005; Debar 2012; Ebbeling 2003; Ford 2010; Gourlan 2013; Hofsteenge 2014; Jiang 2005; Kong 2013; Love-Osborne 2014; NCT00132132; NCT00807560; Patrick 2013; Pbert 2013; Pitetti 2007; Saelens 2002; Savoye 2007; Vissers 2008; Visuthranukul 2015; van Egmond-Frohlich 2006). Twelve trials used a concomitant therapy (Brownell 1983; Chandra 1968; Grey 2009; Jelalian 2016; Kong 2014; Nguyen 2012; Norman 2016; Resnicow 2005; Sigal 2014; Walpole 2013; Wengle 2011; Wong 2015).

Overview of trial populations

The 44 trials included 4781 participants. Approximately 2555 were randomised to an intervention and 1850 to a comparator. The proportion of participants finishing the study, where reported, ranged from 34% to 100% in the intervention groups and from 38% to 100% in the comparator groups. Individual sample size ranged from 10 to 521.

Study design

Thirty-nine trials were parallel comparisons with individual randomisation. Four trials were cluster RCTs (Grey 2009; Kong 2013; Pbert 2013; Resnicow 2005), and one was a cross-over trial (Brennan 2013). All 44 trials had a superiority design. Five trials had three arms (Brownell 1983; Daley 2005; Norman 2016; Pakpour 2015; Patsopoulou 2017), and two trials had four arms (Patrick 2013; Sigal 2014). The majority (24) were single centre trials, although the number of centres was unclear or not reported in 10 trials. Two trials had six centres (Grey 2009; Kong 2013), and one study each had two (Brennan 2013), eight (Pbert 2013), 10 (Resnicow 2005), 12 (Toulabi 2012), 15 (Patsopoulou 2017) or 18 (Patrick 2013) centres. Trials were performed from 1968 to 2015. The duration of the intervention ranged from six weeks to two years, and the duration of follow-up ranged from six months to two years. Eight trials had some form of run-in period prior to the start of the study (Brownell 1983; Chandra 1968; Luna-Pech 2014; Norman 2016; Pitetti 2007; Schranz 2014; Sigal 2014; Wengle 2011). None of the trials was terminated early.

Settings

The interventions were carried out in a variety of settings. These included in schools in nine trials (Carrel 2005; Grey 2009; Jiang 2005; Kong 2013; Love-Osborne 2014; Pbert 2013; Pitetti 2007; Toulabi 2012; Vissers 2008), in the community or home in eight trials (Ebbeling 2012; Nguyen 2012; Patrick 2013; Patsopoulou 2017; Resnicow 2005; Saelens 2002; Schranz 2014; Sigal 2014), and various healthcare settings, including outpatients, primary care, research clinics and other hospital sites in 26 trials (based on author locations where the study did not explicitly report this) (Bean 2014; Boodai 2014; Brennan 2013; Brownell 1983; Carraway 2014; Chandra 1968; Christie 2011; Daley 2005; Debar 2012; Ebbeling 2003; Ford 2010; Gourlan 2013; Hofsteenge 2014; Jelalian 2016; Kong 2014; Luna-Pech 2014; NCT00132132; NCT00807560; Norman 2016; Pakpour 2015; Savoye 2007; Visuthranukul 2015; Vos 2011; Walpole 2013; Wengle 2011; Wong 2015).

Participants

The diagnostic criteria for overweight and obesity differed between the trials. Twelve trials included participants with BMI on or above the 85th percentile for age and height (Bean 2014; Carraway 2014; Ebbeling 2012; Grey 2009; Jelalian 2016; Kong 2013; Love-Osborne 2014; NCT00132132; NCT00807560; Pbert 2013; Walpole 2013; Wengle 2011), nine trials used a cutoff of on or above the 95th percentile (Boodai 2014; Carrel 2005; Ebbeling 2003; Ford 2010; Kong 2014; Luna-Pech 2014; Norman 2016; Pakpour 2015; Savoye 2007), three trials used a cut-off of on or above the 90th percentile (Debar 2012; Gourlan 2013; Resnicow 2005), and two trials used a cut-off of on or above the 98th percentile (Christie 2011; Daley 2005). The remaining trials used a range of different criteria to define overweight or obesity for inclusion in the trials (Characteristics of included studies table; Appendix 3).

Thirty-four trials reported the mean BMI at baseline (Brennan 2013; Brownell 1983; Carrel 2005; Christie 2011; Debar 2012; Ebbeling 2003; Ebbeling 2012; Ford 2010; Gourlan 2013; Grey 2009; Hofsteenge 2014; Jelalian 2016; Jiang 2005; Kong 2014; Love-Osborne 2014; Luna-Pech 2014; NCT00807560; Nguyen 2012; Norman 2016; Pakpour 2015; Patsopoulou 2017; Pbert 2013; Pitetti 2007; Resnicow 2005; Saelens 2002; Savoye 2007; Schranz 2014; Sigal 2014; Toulabi 2012; Vissers 2008; Visuthranukul 2015; Vos 2011; Walpole 2013; Wengle 2011) and ranged from 26 kg/m² to 37 kg/m² in all but one study

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 14 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. (Brownell 1983), which was an outlier with BMIs in the three study groups ranging from 42 kg/m² to 45.5 kg/m². Sixteen trials reported BMI z scores (Bean 2014; Boodai 2014; Brennan 2013; Carraway 2014; Daley 2005; Love-Osborne 2014; Luna-Pech 2014; NCT00807560; Nguyen 2012; Norman 2016; Pakpour 2015; Patrick 2013; Pbert 2013; Vos 2011; Walpole 2013; Wengle 2011), and these ranged across all trials between 1.8 and 3.2 with the exception of one study (Vos 2011), which had a mean BMI Standard Deviation Score (SDS) of 4.2. One study reported BMI percentile only at baseline (at 94.5%) (Kong 2013), and two trials did not report BMI measures at baseline (Chandra 1968; Gourlan 2013). Twenty trials reported on change in weight.

Thirty-seven trials reported the gender of the study participants (Bean 2014; Boodai 2014; Brennan 2013; Brownell 1983; Carrel 2005; Chandra 1968; Christie 2011; Daley 2005; Debar 2012; Ebbeling 2003; Ebbeling 2012; Ford 2010; Gourlan 2013; Grey 2009; Hofsteenge 2014; Jelalian 2016; Jiang 2005; Kong 2013; Kong 2014; Love-Osborne 2014; Luna-Pech 2014; NCT00132132; NCT00807560; Nguyen 2012; Norman 2016; Pakpour 2015; Patrick 2013; Pbert 2013; Pitetti 2007; Resnicow 2005; Savoye 2007; Schranz 2014; Sigal 2014; Vissers 2008; Visuthranukul 2015; Vos 2011; Walpole 2013, and the proportion of participants who were female ranged from 33% to 77% in all cases except the trials by Debar 2012 and Resnicow 2005 where all participants were female, and Schranz 2014 where all participants were male. Four trials did not report the gender of participants at baseline (Saelens 2002; Toulabi 2012; Wengle 2011; Wong 2015). Participants ages ranged from 12 to 17.5 years in all trials that reported mean age at baseline, 11 trials did not report mean age at baseline (Brennan 2013; Brownell 1983; Chandra 1968; Christie 2011; Daley 2005; Gourlan 2013; NCT00132132; Resnicow 2005; Saelens 2002; Toulabi 2012; Wong 2015).

Nineteen trials reported ethnicity (Bean 2014; Brownell 1983; Carraway 2014; Daley 2005; Debar 2012; Ebbeling 2012; Ford 2010; Grey 2009; Hofsteenge 2014; Jelalian 2016; Kong 2013; Love-Osborne 2014; Norman 2016; Patrick 2013; Pbert 2013; Resnicow 2005; Savoye 2007; Sigal 2014; Vos 2011). Most trials reported a mixture of ethnic backgrounds for their participants as can be seen in Appendix 3, two trials reported exclusively on African-Americans (Resnicow 2005) and participants described as 'white' (Brownell 1983).

Three trials focused on participants with specific conditions, Jelalian 2016 included people with depression, Luna-Pech 2014 included people with asthma and Pitetti 2007 included people with autism living in a residential school.

Interventions

Thirty-four trials included interventions that were multidisciplinary (Bean 2014; Boodai 2014; Brennan 2013; Brownell 1983; Christie 2011; Daley 2005; Debar 2012; Gourlan 2013; Grey 2009; Hofsteenge 2014; Jelalian 2016; Jiang 2005; Kong 2013; Kong 2014; Love-Osborne 2014; NCT00132132; NCT00807560; Nguyen 2012; Norman 2016; Pakpour 2015;

Patrick 2013; Patsopoulou 2017; Pbert 2013; Resnicow 2005; Saelens 2002; Savoye 2007; Sigal 2014; Toulabi 2012; van Egmond-Frohlich 2006; Vissers 2008; Vos 2011; Walpole 2013; Wengle 2011; Wong 2015), where the focus was on at least two components of diet, physical activity and behavioural approaches to weight management. Five trials were focused solely on dietary interventions (Ebbeling 2003; Ebbeling 2012; Ford 2010; Luna-Pech 2014; Visuthranukul 2015), and five focused solely on physical activity interventions (Carraway 2014; Carrel 2005; Chandra 1968; Pitetti 2007; Schranz 2014). Twenty-nine trials had a theoretical basis to their interventions, these included six which had a cognitive behavioural or social cognitive theoretical basis (Hofsteenge 2014; Jelalian 2016; Nguyen 2012; Norman 2016; Pbert 2013; Vos 2011), eight which used motivational interviewing approaches (Bean 2014; Brennan 2013; Christie 2011; Gourlan 2013; Love-Osborne 2014; Pakpour 2015; Resnicow 2005; Walpole 2013), and 15 that used a variety of other psychological approaches (Boodai 2014; Brownell 1983; Daley 2005; Debar 2012; Grey 2009; Jiang 2005; Kong 2013; Kong 2014; NCT00132132; Patrick 2013; Saelens 2002; Savoye 2007; Toulabi 2012; Vissers 2008; Wengle 2011). Thirteen trials did not use a behavioural approach or did not report the theoretical basis to any behavioural component of their intervention (Carrel 2005; Chandra 1968; Ebbeling 2003; Ebbeling 2012; Ford 2010; Luna-Pech 2014; NCT00807560; Patsopoulou 2017; Pitetti 2007; Schranz 2014; Sigal 2014; Visuthranukul 2015; Wong 2015). Twenty-six trials involved parents in the intervention (Bean 2014; Boodai 2014; Brennan 2013; Brownell 1983; Carraway 2014; Christie 2011; Daley 2005; Debar 2012; Ebbeling 2012; Grey 2009; Hofsteenge 2014; Jelalian 2016; Jiang 2005; Kong 2013; Kong 2014; NCT00807560; Nguyen 2012; Norman 2016; Pakpour 2015; Patrick 2013; Resnicow 2005; Savoye 2007; Toulabi 2012; Visuthranukul 2015; Vos 2011; Wengle 2011). In 15 trials, there was no parental involvement (Carrel 2005; Chandra 1968; Ebbeling 2003; Ford 2010; Gourlan 2013; Love-Osborne 2014; Luna-Pech 2014; NCT00132132; Pbert 2013; Pitetti 2007; Saelens 2002; Schranz 2014; Sigal 2014; Vissers 2008; Walpole 2013), and in three trials there were two intervention groups, one which included the parent and one which did not (Brownell 1983; Pakpour 2015; Patsopoulou 2017).

Nineteen trials delivered the intervention in a group format (Boodai 2014; Brownell 1983; Carrel 2005; Christie 2011; Daley 2005; Debar 2012; Grey 2009; Hofsteenge 2014; NCT00132132; Nguyen 2012; Pakpour 2015; Patsopoulou 2017; Pitetti 2007; Resnicow 2005; Savoye 2007; Schranz 2014; Toulabi 2012; Visuthranukul 2015; Vos 2011), for specific details see Characteristics of included studies table. In 14 studies, the intervention was individually based (Bean 2014; Brennan 2013; Ebbeling 2012; Ford 2010; Gourlan 2013; Jiang 2005; Kong 2013; Kong 2014; Luna-Pech 2014; Norman 2016; Pbert 2013; Saelens 2002; Sigal 2014; Walpole 2013), and in 10 studies, there was a mixture of some group and some individual sessions, or

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 15 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. the trial did not report the mode of delivery (Carraway 2014; Chandra 1968; Ebbeling 2003; Jelalian 2016; Love-Osborne 2014; NCT00807560; Patrick 2013; Vissers 2008; Wengle 2011; Wong 2015).

The duration of the intervention was six months or less in 30 trials (Bean 2014; Boodai 2014; Brennan 2013; Brownell 1983; Carraway 2014; Chandra 1968; Christie 2011; Daley 2005; Debar 2012; Ebbeling 2003; Gourlan 2013; Grey 2009; Jelalian 2016; Kong 2013; Kong 2014; NCT00807560; Pakpour 2015; Patsopoulou 2017; Pbert 2013; Resnicow 2005; Saelens 2002; Schranz 2014; Sigal 2014; Toulabi 2012; Vissers 2008; Visuthranukul 2015; Vos 2011; Walpole 2013; Wengle 2011; Wong 2015), and greater than six months in 14 trials (Carrel 2005; Ebbeling 2012; Ford 2010; Hofsteenge 2014; Jiang 2005; Love-Osborne 2014; Luna-Pech 2014; NCT00132132; Nguyen 2012; Norman 2016; Patrick 2013; Pitetti 2007; Savoye 2007; van Egmond-Frohlich 2006).

Outcomes

Twenty-three trials explicitly stated a primary endpoint in the publication (Appendix 5); in 20 of these, this was a measure of body composition such as weight or BMI. In the trial by Schranz 2014, the primary outcomes were exercise self-efficacy, physical selfworth and self-esteem. In the trial by Walpole 2013, the primary outcome was self-efficacy and in Daley 2005 the primary outcome was physical self-perceptions. All except one of the included trials (Chandra 1968) reported a BMI variable as an outcome; this was BMI in 29 trials, BMI z score in 20 trials, BMI percentile in five trials (15 trials reported more than one BMI variable, Brennan 2013; Debar 2012; Hofsteenge 2014; Jiang 2005; NCT00807560; Nguyen 2012; Norman 2016; Pakpour 2015; Patrick 2013; Pbert 2013; Saelens 2002; Savoye 2007; Visuthranukul 2015; Walpole 2013; Wengle 2011). Twenty trials reported weight and five trials reported rates of adverse events as described in the Effects of interventions section. Twenty-nine trials reported other anthropometric measures (Boodai 2014; Brennan 2013; Brownell 1983; Carraway 2014; Carrel 2005; Chandra 1968; Ebbeling 2003; Ebbeling 2012; Ford 2010; Grey 2009; Hofsteenge 2014; Kong 2013; Kong 2014; NCT00132132; Nguyen 2012; Norman 2016; Pakpour 2015; Patrick 2013; Patsopoulou 2017; Pbert 2013; Saelens 2002; Savoye 2007; Schranz 2014; Sigal 2014; Toulabi 2012; Vissers 2008; Vos 2011; Walpole 2013; Wengle 2011); this was percent body fat in 14 trials, trunk fat percentage in two trials, waist circumference in 16 trials, waist-to-height ratio in three trials, waist-to-hip ratio in two trials, fat mass in five trials, trunk fat mass in two trials, lean mass in three trials and percentage of overweight in two trials. Nine trials reported healthrelated quality of life (Debar 2012; Ford 2010; Hofsteenge 2014; Nguyen 2012; Luna-Pech 2014; Pakpour 2015; Patrick 2013; van Egmond-Frohlich 2006; Vos 2011). Nine trials reported self-esteem (Brennan 2013; Carraway 2014; Daley 2005; Debar 2012; Hofsteenge 2014; Nguyen 2012; Pakpour 2015; Patrick 2013; Schranz 2014). Eleven trials reported behavioural change in terms

of dietary intake (Brennan 2013; Ebbeling 2003; Ebbeling 2012; Kong 2013; Kong 2014; Pakpour 2015; Patrick 2013; Pbert 2013; Saelens 2002; Visuthranukul 2015; Wengle 2011), while four trials reported dietary behaviour (Brennan 2013; Ford 2010; Grey 2009; Pakpour 2015). Twelve trials reported behavioural change in terms of physical activity (Debar 2012; Ebbeling 2012; Gourlan 2013; Grey 2009; Jelalian 2016; Kong 2013; Kong 2014; Pakpour 2015; Pbert 2013; Saelens 2002; Sigal 2014; Wengle 2011), while three trials reported physical activity behaviour (Grey 2009; Kong 2013; Pakpour 2015). One trials reported parenting and relationships (Brennan 2013). Eight trials reported views of the intervention (Brennan 2013; Christie 2011; Debar 2012; Jelalian 2016; Nguyen 2012; Pbert 2013; Saelens 2002; Wengle 2011).

Ten trials reported outcomes at more than one time point (Debar 2012; Ebbeling 2012; Hofsteenge 2014; Jiang 2005; Nguyen 2012; Norman 2016; Patrick 2013; Resnicow 2005; Savoye 2007; Schranz 2014).

Excluded studies

We excluded 570 of 736 articles after evaluation of the publication. The main reasons for exclusion were the intervention (aim not focused on treating overweight/obesity and duration of intervention and follow-up less than six months) and study design (not an RCT). Many trials had other reasons for exclusion such as lack of relevant outcomes or the control was not no intervention/usual care or concomitant intervention as long as this was also provided in the intervention arm (for further details see Characteristics of excluded studies table, which lists the 44 studies that closely missed the inclusion criteria for this review).

Studies awaiting classification

Twelve studies are awaiting classification as we await clarification from the study authors. These may be included when this review is updated if they meet the inclusion criteria.

Ongoing studies

Fifty studies are ongoing or have completed but results are not available. These may be included when this review is updated if they meet the inclusion criteria.

Risk of bias in included studies

For details on risk of bias of included studies, see the Characteristics of included studies table. For an overview of review authors' judgements about each risk of bias item for individual studies and across all studies, see Figure 2 and Figure 3. Many trials did not report adequate information to assess the risk of bias and we assessed 30 trials at high risk of bias on at least one domain. We assessed 10 trials at high risk of bias on three or more domains (Daley 2005; Hofsteenge 2014; Kong 2014; Luna-Pech 2014; NCT00807560;

Allocation

The majority of trials provided sufficient information on random sequence generation and were judged at low risk of bias. However, most trials provided inadequate information on concealment of allocation. Twenty-two studies reported adequate random sequence generation, but only 11 of these also described adequate concealment of allocation (Boodai 2014; Christie 2011; Daley 2005; Jelalian 2016; Kong 2014; Nguyen 2012; Schranz 2014; Sigal 2014; Visuthranukul 2015; Vos 2011; Walpole 2013), and therefore have a low risk of selection bias. One trial described allocation concealment and was at high risk of bias (Patsopoulou 2017). One trial was also high risk of bias for allocation concealment (NCT00807560). The risk of selection bias was uncertain in the remaining 31 included studies.

Blinding

Only one study had a low risk of performance bias (subjective and objective outcomes) as participants and personnel were blinded to treatment allocation (Gourlan 2013). Nineteen studies had a high risk of performance bias for subjective and objective outcomes (Christie 2011; Daley 2005; Hofsteenge 2014; Kong 2014; Luna-Pech 2014; NCT00807560; Nguyen 2012; Pakpour 2015; Patsopoulou 2017; Pbert 2013; Schranz 2014; Sigal 2014) or objective outcomes only (subjective outcomes not reported) (Bean 2014; Boodai 2014; Carrel 2005; Debar 2012; Ford 2010; NCT00132132; Savoye 2007). The risk of performance bias was unclear in the remaining 24 studies.

The risk of detection bias was low for objective outcomes (regardless of whether outcome assessors were blinded to treatment allocation) in 44 studies. For subjective outcomes, six studies blinded outcome assessors (Brennan 2013; Gourlan 2013; Jelalian 2016; Nguyen 2012; Norman 2016; Pakpour 2015), and this was unclear in 17 studies (Carraway 2014; Christie 2011; Debar 2012; Ebbeling 2003; Ebbeling 2012; Grey 2009; Kong 2013; NCT00807560; Patrick 2013; Patsopoulou 2017; Saelens 2002; Toulabi 2012; van Egmond-Frohlich 2006; Visuthranukul 2015; Vos 2011; Wengle 2011; Wong 2015). The risk of detection bias was judged to be high in the remaining seven studies reporting subjective ouLena1234tcomes (Daley 2005; Hofsteenge 2014; Kong 2014; Luna-Pech 2014; Pbert 2013; Schranz 2014; Sigal 2014).

Incomplete outcome data

The risk of attrition bias was low in 17 studies (Brennan 2013; Carraway 2014; Ebbeling 2003; Ebbeling 2012; Gourlan 2013; Grey 2009; Hofsteenge 2014; Nguyen 2012; Norman 2016; Patrick 2013; Pbert 2013; Pitetti 2007; Resnicow 2005; Savoye 2007; Sigal 2014; Vos 2011; Walpole 2013). Eleven studies had a high risk of attrition bias on objective and subjective (where reported) outcome measures due to an imbalance in attrition between study groups (Carrel 2005; Jelalian 2016; Kong 2013; Kong 2014; Love-Osborne 2014; NCT00132132; NCT00807560; Saelens 2002; Schranz 2014; van Egmond-Frohlich 2006; Vissers 2008). The remaining 16 studies were at unclear risk of bias due to insufficient reporting of attrition, such as not providing reasons for missing data.

Selective reporting

Fourteen studies were at high risk of reporting bias (Boodai 2014; Brennan 2013; Ebbeling 2003; Ford 2010; Hofsteenge 2014; Love-Osborne 2014; NCT00807560; Norman 2016; Pbert 2013; Pitetti 2007; Schranz 2014; Sigal 2014; van Egmond-Frohlich 2006; Vos 2011). In 17 studies, this was unclear, as the study protocol or trial record were unavailable, or the trial had yet to be fully published. The remaining 13 studies reported all outcomes as stated.

Other potential sources of bias

There was high risk of bias in one study as the run-in programme was conducted to minimise participant attrition, but may have resulted in a more motivated sample of participants and parents compared with non-run-in trial cohorts (Norman 2016). There was an unclear risk of other sources of bias in 10 studies (Bean 2014; Boodai 2014; Brennan 2013; Carraway 2014; Grey 2009; Kong 2013; NCT00132132; NCT00807560; Pbert 2013; Wong 2015). In one of these studies, the participating churches (which were the unit of randomisation) requested that the comparison condition received a meaningful intervention, which may have had an impact on results (Resnicow 2005). The remaining 32 studies were at low risk of other sources of bias.

Effects of interventions

See: **Summary of findings for the main comparison** Diet, physical activity and behavioural interventions for the treatment of overweight or obesity in adolescents aged 12 to 17 years None of the included studies reported all-cause mortality, morbidity and socioeconomic effects.

All diet, physical activity and behavioural interventions versus controls

Primary outcomes

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 19 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. Forty-four trials compared a diet, physical activity, behavioural intervention or a combination of these with usual care, no active intervention or wait list control or a concomitant therapy. Five studies assessed more than one intervention (Brownell 1983; Pakpour 2015; Patrick 2013; Patsopoulou 2017; Sigal 2014). In one three arm trial, Brownell 1983 assessed a multicomponent intervention with three different approaches; mothers attended sessions with the adolescents, mothers attended separate sessions to the adolescent or only the adolescents received the intervention. The study by Pakpour 2015 compared motivational interviewing with a passive control (no details); there were two intervention groups, one with parental involvement and one without. In the study by Patsopoulou 2017, there were two intervention groups compared to no intervention, an activity group and an activity plus diet group with parental involvement. Sigal 2014 allocated participants to four arms comparing different physical activity interventions with a diet-only control group. All groups received the dietary intervention and this was compared to a diet plus aerobic exercise intervention, a diet plus resistance training intervention and a diet plus aerobic plus resistance training intervention. The study by Patrick 2013 compared three different website interventions (website alone, website and group sessions, website and text messages) with a usual care control. There were no substantial differences in the study between the interventions and these were therefore merged into one group as described in the Measures of treatment effect section. One study provided gender stratified analyses (Norman 2016). One study had two control groups, a usual care control and an exercise placebo of body conditioning (an attention control) (Daley 2005). As there was no aim in the study to test the difference between these two control groups, and the attention control was not intended to promote weight control, we merged these two groups into one control arm for the purpose of the review. The other 37 trials each assessed different interventions as described above (Bean 2014; Boodai 2014; Brennan 2013; Carrel 2005; Chandra 1968; Christie 2011; Debar 2012; Ebbeling 2003; Ebbeling 2012; Ford 2010; Gourlan 2013; Grey 2009; Hofsteenge 2014; Jelalian 2016; Jiang 2005; Kong 2013; Kong 2014; NCT00132132; NCT00807560; Nguyen 2012; Love-Osborne 2014; Luna-Pech 2014; Norman 2016; Pbert 2013; Pitetti 2007; Resnicow 2005; Saelens 2002; Savoye 2007; Schranz 2014; Sigal 2014; Toulabi 2012; van Egmond-Frohlich 2006; Vissers 2008; Visuthranukul 2015; Vos 2011; Walpole 2013; Wengle 2011).

Outcomes are considered here at the longest point of follow-up for each study. Sensitivity analyses and subgroup analyses around these outcomes are reported below.

Changes in body mass index or body weight

All but one study (Chandra 1968) reported BMI variables as outcomes. Twenty-nine studies reported BMI and 20 studies reported BMI z score. Twenty-eight trials (33 comparisons) reported BMI change data that were suitable for meta-analysis. Pooling the studies in a random-effects meta-analysis demonstrated a reduction in BMI in the intervention groups compared with control groups at the longest point of follow-up (MD -1.18 kg/m² (95% CI -1.67 to -0.69); P < 0.00001; 2774 participants; 28 studies; 34 comparisons; low quality evidence; Analysis 1.1).

Meta-analysis of BMI z score at the longest point of follow-up showed a reduction in the intervention groups compared with the control groups (MD -0.13 units (95% CI -0.21 to -0.05); P = 0.002; 2399 participants; 20 studies; low quality evidence; Analysis 1.2).

Five studies did not report BMI or BMI z score outcomes in a format that was suitable for meta-analysis (Carraway 2014; Christie 2011; Love-Osborne 2014; Walpole 2013; Wong 2015). The study by Walpole 2013 reported median BMI and BMI z scores and the study reported no substantial differences between groups. In the study by Wong 2015, the mean BMI z score did not substantially differ between groups. Christie 2011 reported the effect estimate for BMI at six months, which was not substantially different between groups. The study by Love-Osborne 2014 reported the proportion of participants with increases or decreases in BMI z scores at different thresholds. The only relevant result was that a higher proportion of participants in the control group decreased their BMI z score by at least 0.1 compared with the intervention group. One study has not currently reported BMI outcomes having only recently published secondary outcomes (Bean 2014). The study by Carraway 2014 did not present BMI data for a mentorled exercise programme compared with wait list control.

Five studies reported BMI percentiles (Bean 2014; Brennan 2013; Debar 2012; Kong 2013; Patrick 2013). Analysis 1.3 shows results from four studies (Brennan 2013; Debar 2012; NCT00807560; Patrick 2013). The results favoured the interventions in two studies. In one study, where three interventions were combined, there was a reduction in the BMI percentile in the control group (Patrick 2013). Kong 2013 reported the median BMI percentile. This reduced in the intervention group and increased in the control group (P = 0.04). Bean 2014 did not report data.

Twenty studies (24 comparisons) reported weight change and were pooled in a random-effects meta-analysis which demonstrated a reduction in weight in the intervention groups compared with controls at the longest point of follow-up (MD -3.67 kg (95% CI -5.21 to -2.13); P < 0.00001; 1993 participants; 20 studies; moderate quality evidence; Analysis 1.4).

Adverse events

Five trials reported rates of adverse events (Ebbeling 2012; Ford 2010; NCT00132132; NCT00807560; Sigal 2014). There were no adverse events reported in either group in the studies by Ford 2010; NCT00132132; and NCT00807560. In the study by Ebbeling 2012, 6.4% of participants experienced an adverse event in the intervention group (no details); it was not reported

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 20 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. whether adverse events occurred in the comparator group. Sigal 2014 reported the proportions of participants experiencing adverse events, the proportion withdrawing owing to adverse events and detailed the specific adverse events in each of their four groups (see Appendix 8 for details). Adverse events were experienced in 25% of participants in the diet plus aerobic exercise group; 19% in the diet plus resistance training group; 21% in the diet plus aerobic plus resistance training group and 24% in the diet-only group.

Secondary outcomes

Anthropometric measures other than body mass index

Twenty-eight trials reported anthropometric measures other than BMI using objective measures (Boodai 2014; Brownell 1983; Brennan 2013; Carrel 2005; Ebbeling 2003; Ebbeling 2012; Ford 2010; Grey 2009; Hofsteenge 2014; Kong 2013; Kong 2014; NCT00132132; NCT00807560; Nguyen 2012; Norman 2016; Pakpour 2015; Patrick 2013; Patsopoulou 2017; Pbert 2013; Saelens 2002; Savoye 2007; Schranz 2014; Sigal 2014; Toulabi 2012; Vissers 2008; Vos 2011; Walpole 2013; Wengle 2011). Fourteen studies reported percentage of body fat change that was suitable for meta-analysis. Meta-analysis demonstrated a reduction in percentage of body fat in the intervention group compared with the control group at the longest follow-up points (MD -1.08% (95% CI -1.69 to -0.46); P = 0.0006; 1886 participants; 14 studies; Analysis 3.1). Three studies reported other measures of body fat that included percentage of fat (Carraway 2014; Pakpour 2015), and percentage of body fat-SDS (Ford 2010). All three studies found a reduction in body fat in the intervention group compared to the control group (see Table 2 for details).

Two trials reported data for percentage of trunk fat that was suitable for meta-analysis. Random-effects meta-analysis showed an MD of -0.84% ((95% CI -3.10 to 1.43); P = 0.47; 123 participants; 2 trials; Analysis 3.2).

Seventeen trials reported data for waist circumference that was suitable for meta-analysis. Random-effects meta-analysis demonstrated a reduction in waist circumference in the intervention group compared with the control group at the longest follow-up points (MD -2.26 cm (95% CI -3.80 to -0.72); P = 0.004; 1997 participants; 17 trials; Analysis 3.3). Two studies reported other measures of abdominal adiposity (Kong 2014; Vos 2011). Percentage of visceral fat did not change in either the intervention or control group (Kong 2013). One study found that both waist circumference minus SDS and waist-to-height ratio significantly decreased in the intervention arm compared to the control arm (Vos 2011) (see Table 2 for details).

Pooling three trials in a random-effects meta-analysis showed no substantial reduction in waist-to-height ratio in the intervention group compared to control group at the longest follow-up points (MD 0 (95% CI -0.02 to 0.02); P = 0.98; 276 participants; 3 trials; Analysis 3.4). Waist-to-hip ratio did not substantially reduce in the intervention group compared to the control group (MD 0.01 (95% CI -0.01 to 0.03); P = 0.22; 211 participants; 2 trials; Analysis 3.5). In one study, hip circumference seemed to decrease in the intervention group compared to the control group (Toulabi 2012; see Table 2).

Five trials reported data for fat mass that was suitable for meta-analysis. Pooling the studies in a random-effects meta-analysis demonstrated a reduction in fat mass in the intervention group compared to the control group at the longest follow-up points (MD -3.13 kg (95% CI -4.70 to -1.56); P < 0.0001; 673 participants; 5 trials; Analysis 3.6). The study by Schranz 2014 found no substantial difference for the reduction in body mass between the intervention and control groups (see Table 2 for details).

Two trials reported data for trunk fat mass that was suitable for meta-analysis. Random-effects meta-analyses showed no substantial reduction in trunk fat mass in the intervention group compared to the control group (MD -0.94 kg (95% CI -2.49 to 0.61); P = 0.24; 184 participants; 2 trials; Analysis 3.7).

Three trials reported data for lean mass that was suitable for metaanalysis. Random-effects meta-analysis showed no substantial increase in body lean mass in the intervention group compared to the control group (MD -0.21 kg (95% CI -0.88 to 0.47); P = 0.55; 417 participants; 3 trials; Analysis 3.8). The Brennan 2013 trial found that participants in the intervention group had lower truncal lean mass compared to the control group, however, statistical significance was not reported (see Table 2 for details).

Two trials reported data for percentage of overweight that was suitable for meta-analysis. Random-effects meta-analysis showed no substantial difference in the percentage of overweight between the intervention group and control group (MD -5.55% (95% CI -13.67 to 2.57); P = 0.18; 73 participants; 2 trials; Analysis 3.9). One study reported percentage of BMI reduction and found that 75% of participants in the intervention group reduced their BMI compared to 23% of participants in the control group (NCT00132132). In one trial, percentage of overweight reduced in both intervention and control at seven months' follow-up (Carraway 2014; see Table 2 for details). In one study, percentage of boys over the median BMI was lower in the intervention group compared to boys in the control group (Norman 2016). In an earlier study, average weight loss was not lower in the intervention group compared to the control (Chandra 1968; see Table 2).

Health-related quality of life and self-esteem

Thirteen trials reported health-related quality of life and self-esteem using validated self-reported tools (Brennan 2013; Carraway 2014; Daley 2005; Debar 2012; Ford 2010; Hofsteenge 2014; Luna-Pech 2014; Nguyen 2012; Patrick 2013; Pakpour 2015; Schranz 2014; van Egmond-Frohlich 2006; Vos 2011). Seven trials reported data for health-related quality of life change that was

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 21 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. suitable for meta-analysis. Random-effects meta-analysis demonstrated an improvement in health-related quality of life in the intervention group compared with the control group at the longest follow-up points ((SMD 0.44 (95% CI 0.09 to 0.79); P = 0.01; 972 participants; 7 studies; low quality evidence Analysis 4.1). An SD of 0.44 represents a moderate difference between groups (Higgins 2011a). The study by Ford 2010 reported narrative findings of health-related quality of life that improved in both the intervention and control arms but did not reach statistical significance (see Table 3 for further details).

Six trials reported data for self-esteem change that was suitable for meta-analysis. Random-effects meta-analysis demonstrated no substantial improvement in self-esteem for either group at the longest follow-up points (SMD 0.09 (95% CI -0.08 to 0.27; P = 0.30, 613 participants; 6 trials; Analysis 4.3). Four trials reported other measures of self-esteem and found no substantial improvement in either group for body appearance, weight satisfaction, body attribution (Hofsteenge 2014), weight efficacy (Pakpour 2015), and physical self-worth (Schranz 2014; van Egmond-Frohlich 2006). One trial reported improvement in global self-esteem post intervention and at seven months' followup for both intervention and control (Carraway 2014) (see Table 3 for further details).

All-cause mortality

None of the studies reported all-cause mortality.

Morbidity

None of the studies reported morbidity.

Behavioural change

Dietary intake

Six trials (454 participants) reported macronutrient and glycaemic consumption assessed by either food record or 24-hour dietary recall (Ebbeling 2003; Ebbeling 2012; Kong 2014; Pbert 2013; Saelens 2002; Visuthranukul 2015). Monitored intakes included fat, protein, carbohydrates, sugar, fibre, glycaemic load and glycaemic index.

Three trials reported fat intake as percentage of total energy intake for 132 participants (Ebbeling 2003; Pbert 2013; Saelens 2002). There was no substantial reduction in fat intake in either group in the studies by Pbert 2013 and Saelens 2002. In the study by Ebbeling 2003, fat intake significantly decreased in the control group but increased in the intervention group at 12 months (see Table 4 for details).

Two trials reported protein intake as percentage of total energy intake for 75 participants (Ebbeling 2003; Kong 2014). At 12

months, there was no substantial increase in protein intake in the either group in the study by Ebbeling 2003. In the study by Kong 2014 the intervention group increased protein consumption compared to the control group at six months (see Table 4 for details). The same trials (Ebbeling 2003; Kong 2014) reported carbohydrate intake. There was no substantial change in carbohydrate consumption in either the intervention or control group at six and 12 months (see Table 4 for details).

Two trials reported total sugar intake for 291 participants (Ebbeling 2012; Pbert 2013). Participants in the intervention group reported lower intakes compared to the control group in both studies (Ebbeling 2012; Pbert 2013). See Table 4 for details. Two trials reported fibre intake for 75 participants (Ebbeling 2003; Kong 2014). At 12 months, fibre intake did not change substantially in either the intervention or control group in one study (Ebbeling 2003). The second study reported an increase in fibre consumption in the intervention group compared to the control group (Kong 2014). See Table 4 for details.

Three trials reported glycaemic load intake for 157 participants (Ebbeling 2003; Kong 2014; Pbert 2013). Glycaemic load decreased in the intervention group in two studies (Ebbeling 2003; Pbert 2013), but there was no substantial difference between the intervention and control groups in one study (Kong 2014). See Table 4 for details.

Three trials reported glycaemic index intake for 127 participants (Ebbeling 2003; Kong 2014; Visuthranukul 2015). Glycaemic index did not change in either group in the studies by Ebbeling 2003 and Kong 2014. At six months, the intervention group (25 participants) reported a higher consumption of low glycaemic index foods compared to the control group (27 participants) in one study (Visuthranukul 2015). See Table 4 for details.

Five trials (650 participants) reported fruit and vegetable intake (Brennan 2013; Kong 2013; Pakpour 2015; Patrick 2013; Wengle 2011), while two trials (408 participants) reported vegetable intake (Brennan 2013; Pakpour 2015). Dietary consumption was assessed using the Fat, Fruit and Vegetable Diet Questionnaire (FFVDQ), diet record or dietary questions from the Center for Disease Control Youth Risk Behavior System (YRBS). In all studies, except for one (Pakpour 2015), fruit and vegetable consumption did not substantially increase. In the study by Pakpour 2015, the motivational interviewing and parental involvement group had a significantly higher intake of fruit servings compared to the control group. See Table 4 for details.

Four trials (668 participants) reported beverage consumption (juice, milk and sugar-sweetened drinks) assessed by either dietary questions YRBS, 24-hour dietary recall or Food Frequency Questionnaire (FFQ) (Brennan 2013; Ebbeling 2012; Kong 2013; Pakpour 2015). Juice and milk consumption did not change substantially in either the intervention and control group in three trials (Brennan 2013; Ebbeling 2012; Pakpour 2015). Reports on sugar-sweetened drinks (606 participants) were significantly lower in the intervention group compared to the control group (Ebbeling

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 22 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. 2012; Kong 2013; Pakpour 2015). See Table 4 for details.

Five trials (742 participants) reported several dietary findings assessed by the FFQ, 24-hour dietary recall or the food record (Brennan 2013; Ebbeling 2012; Pakpour 2015; Pbert 2013; Wengle 2011) (see Table 4 for details). The consumption of fatty food items generally decreased in the intervention group compared to the control group (Pakpour 2015; Wengle 2011). There was no substantial difference between the intervention and control groups in healthier dietary consumption such as increasing salad intake and reducing added sugar (Brennan 2013; Pbert 2013). However, whole-grain intake (Wengle 2011) and unsweetened beverage consumption (Ebbeling 2012) were higher in the intervention group compared to the control group.

Dietary behaviour

Four trials (674 participants) reported changes in dietary behaviours assessed by either objective (e.g. Mandometer) or validated self-reported questionnaires (e.g. FFVDQ) (Brennan 2013; Ford 2010; Grey 2009; Pakpour 2015). Eating behaviours such as eating speed and usual food choices did not change substantially in either group in studies by Grey 2009 and Ford 2010. Dietary self-efficacy improved in the intervention group (118 participants) but not in the control group in one study (Pakpour 2015), while there was no change in either group (198 participants) in another study (Grey 2009). Dietary behaviour in relation to fat intake did not improve in either the intervention or control group (Brennan 2013). See Table 5 for details.

Physical activity

Thirteen trials (1376 participants) reported several measures of physical activity assessed using objective tools (Jelalian 2016; Kong 2013; Pbert 2013; Sigal 2014; Wengle 2011), or validated selfreported tools (Debar 2012; Ebbeling 2012; Grey 2009; Gourlan 2013; Kong 2014; Pakpour 2015; Saelens 2002; Sigal 2014). Three trials reported data for mild-to-vigorous physical activity that was suitable for meta-analysis (Kong 2013; Pbert 2013; Wengle 2011), while the study by Jelalian 2016 could not be metaanalysed (Table 6). Random-effects meta-analysis demonstrated no substantial improvement in mild-to-vigorous physical activity (MD 0.39 (95% CI -15.07 to 15.85); P = 0.96; 129 participants; 3 trials; Analysis 5.1). Two trials reported data for activity length (hours per day) that was suitable for meta-analysis (Gourlan 2013; Pakpour 2015). Random-effects meta-analysis showed no substantial improvement in activity length (MD -0.11 hours/day (95% CI -0.98 to 0.75); P = 0.80; 129 participants; 2 trials; Analysis 5.2). Only two trials reported screen time (hours per day) that was suitable for meta-analysis (Ebbeling 2012; Wengle 2011). Random-effects meta-analysis showed a favourable effect for the intervention group compared with the control group at the longest

follow-up points (MD -0.60 hours/day (95% CI -0.65 to -0.55); P < 0.00001; 241 participants; 2 trials; Analysis 5.3).

Overall, physical activity from validated self-reported measures did not substantially improve in either the intervention or control groups for increasing number of steps per day (Sigal 2014; Wengle 2011), amount per day (Debar 2012; Saelens 2002), intensity (Kong 2013), and metabolic equivalent for self-reported physical activity (Debar 2012; Ebbeling 2012; Grey 2009; Kong 2014). See Table 6 for details.

Physical activity behaviour

Three trials (566 participants) reported behavioural change in relation to physical activity assessed by self-reported measures (Grey 2009; Kong 2013; Pakpour 2015), or objective measures (Jelalian 2016). There was no substantial reduction in the hours spent viewing television for either the intervention or control groups in one trial (Kong 2013), while one trial showed a decrease in hours spent in sedentary behaviour in the intervention arm (Jelalian 2016). Two studies reported improvement in physical activity self-efficacy in the intervention group at 12 months (Grey 2009; Pakpour 2015). See Table 7 for details.

Participants' views of the intervention

Eight trials reported participants' views of the multidisciplinary intervention (Brennan 2013; Christie 2011; Debar 2012; Jelalian 2016; Nguyen 2012; Pbert 2013; Saelens 2002; Wengle 2011). Participants reported high levels of satisfaction for the components (Jelalian 2016; Nguyen 2012; Saelens 2002), services (Debar 2012), and overall quality (Brennan 2013) of multidisciplinary interventions. Similarly, participants were satisfied with the person delivering the intervention whether it was a nurse (Debar 2012), mentor (Pbert 2013; Wengle 2011), or clinician (Brennan 2013). Overall, participants thought that a multidisciplinary weight-related programme met their needs (Debar 2012), and in terms of comfort in discussing their behaviour (Pbert 2013), and ability to focus and deal with their concerns (Brennan 2013), and helped them to make behavioural changes (Christie 2011; Nguyen 2012). See Table 8 for details.

Socioeconomic effects

None of the studies reported socioeconomic effects.

Parenting and relationships

Only one trial reported parent-adolescent communication (Brennan 2013). There was no substantial difference between adolescents in the intervention and control groups for parent-adolescent negative, problematic and supportive communication measures (see Table 9). However, participants in the intervention group reported higher positive communication with parents compared to the control group (Brennan 2013).

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 23 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Subgroup analyses

We performed a number of subgroup analyses to test the effects of different durations of follow-up, duration of the interventions, different types of comparators, mode of delivery of the intervention, setting, type of intervention, psychological basis for the interventions and involvement of parents on the outcomes of BMI and BMI z score.

For duration of follow-up, the studies were divided into three subgroups, six months' follow-up, 12 months' follow-up and 18 months' follow-up or more. Some studies reported follow-up at more than one time point and are included in the analyses. There were no subgroup differences regarding duration of follow-up (Analysis 2.1; Analysis 6.1; Analysis 6.2). For change in BMI score (Analysis 2.2), combining studies with a duration of the intervention of six months or less and studies with a duration of the intervention of greater than six months indicated a statistically significant subgroup difference (P = 0.02).

Studies were furthermore divided by whether they had a period of postintervention follow-up (defined as the period after the active intervention and up to the final measurement) and the duration of that period: no postintervention follow-up, less than six months, six months to less than 12 months and postintervention follow-up lasting 12 months or longer. The duration of no postintervention follow-up was calculated by subtracting the active intervention and all follow-up duration). There were no subgroup differences for BMI (Analysis 7.1). For BMI z score, there was a statistically significant subgroup difference (P = 0.007). The effect size for BMI z score appeared greater in studies with a postintervention follow-up lasting 12 months or longer (Analysis 7.2).

When outcomes from studies with comparators described as no intervention or wait list control, usual care or a concomitant therapy were combined, the effect sizes for BMI change appeared larger for studies with no intervention or wait list control comparators and for studies with usual care controls (P = 0.008; Analysis 8.1). Studies were divided into three groups to test the effect of the mode of delivery of the intervention: group, individual and group plus individual delivery. There were no subgroup differences (Analysis 9.1; Analysis 9.2).

For setting, the studies were divided into three subgroups, school, community and healthcare settings. There were no subgroup differences (Analysis 10.1; Analysis 10.2).

The majority of studies were multidisciplinary interventions; however, some studies focused on diet alone or physical activity interventions alone. There were no subgroup differences (Analysis 11.1; Analysis 11.2).

Studies were categorised into four groups according to any theoretical basis for the intervention. These were those applying cognitive behavioural techniques, those applying motivational interviewing techniques, those reporting any other psychological technique and those not reporting any theoretical basis to the intervention or no psychological component to the intervention (BMI: Analysis 12.1; BMI z score: Analysis 12.2). For BMI change, there was a subgroup difference (P = 0.09).

A number of studies involved parents in their interventions while others did not explicitly provide any intervention to parents. There were no subgroup differences (Analysis 13.1; Analysis 13.2).

We performed subgroups analyses to test the effects of different tools of self-reported measures and different outcomes reported. For health-related quality of life, studies were divided into two subgroups, studies using the Pediatric Quality of Life (PedsQL) tool and studies using other self-reported tools. There were no subgroup differences (Analysis 4.4).

Studies measuring self-esteem were divided into two subgroups, studies measuring total self-esteem and studies measuring global self-worth. There were no subgroup differences (Analysis 4.4; Analysis 4.5).

Results of the subgroup analyses should be interpreted with caution given the large number of variable that we assessed.

Sensitivity analyses

We did not perform sensitivity analysis restricting to published studies as all included studies were published. We did not perform sensitivity analysis restricting studies to type of funding as there was no industrial funding influence. We performed sensitivity analyses for the following factors: longest follow-up with 20% or less attrition; longest follow-up with 30% or less attrition; language of publication; study design; removal of one trial specifically aimed at adolescents with severe autism (Pitetti 2007); removal of one trial specifically aimed at overweight adolescents with asthma (Luna-Pech 2014); removal of one trial specifically aimed at overweight or obese adolescents with depression (Jelalian 2016); removal of one trial where there was some uncertainty over the duration of follow-up and no response was received to a request for clarification from the authors (Toulabi 2012), and removal of one study where SDs were imputed from other studies (Pitetti 2007). These sensitivity analyses were undertaken on both the BMI and BMI z score meta-analyses as appropriate to each study.

For the sensitivity analysis testing the effect of attrition, results did not differ between comparisons for either sensitivity analyses when compared with the main summary effects for studies with 20% or less attrition at the longest follow-up: BMI (MD -1.34 kg/m² (95% CI -2.05 to -0.63); P = 0.0002; 1486 participants; 15 studies; 18 comparisons); BMI z score (MD -0.22 (95% CI -0.39 to -0.05); P = 0.01; 951 participants; 11 studies; 11 comparisons) and for studies with 30% or less attrition at the longest follow-up: BMI (MD -1.07 kg/m² (95% CI -1.62 to -0.51); P = 0.0002; 2135 participants; 20 studies; 25 comparisons); BMI z score (MD -0.18 (95% CI -0.32 to -0.05); P = 0.008; 1066 participants; 13 studies; 13 comparisons). Heterogeneity for these sensitivity analyses did not vary consistently when compared with the heterogeneity seen in the main analyses (20% or less attrition: BMI: I² = 72%; BMI z score: I² = 91%; 30% or less attrition: BMI: I² = 77%; BMI z

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 24 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. score: $I^2 = 90\%$). Therefore, we included all studies regardless of rates of attrition in the analyses and subgroup.

Sensitivity analyses on the primary analyses for BMI and BMI z score removing individual trials did not have a considerable impact on the results and these trials were retained in the analyses. The removal of the study by van Egmond-Frohlich 2006 (published in German) slightly increased the BMI z score (MD -0.14 (95% CI -0.23 to -0.05); P = 0.002; 1878 participants; 19 studies; 21 comparisons), but heterogeneity remained the same ($I^2 = 86\%$). The removal of the study by Pitetti 2007 from the BMI analysis did not change the MD or the CIs (MD -1.18 (95% CI -1.67 to -0.69); P < 0.00001; 2764 participants; 27 studies; 33 comparisons). The removal of the study by Jelalian 2016 changed BMI MD and CIs by one second decimal point only (MD -1.17 kg/m² (95% CI -1.66 to -0.68); P < 0.00001; 2750 participants; 27 studies; 33 studies). The removal of the study by Toulabi 2012 reduced the MD in BMI slightly and narrowed the CIs slightly (MD -1.15 kg/m² (95% CI -1.66 to -0.64); P < 0.0001; 2622 participants; 27 studies; 33 comparisons) but the result remained statistically significant with heterogeneity of $I^2 = 78\%$. Removing the study by Luna-Pech 2014 from the BMI z score meta-analysis reduced the MD slightly and narrowed the CIs slightly (MD -0.11 (95%

CI -0.19 to -0.03); P = 0.006; 2348 participants; 19 studies; 21 comparisons) but the result remained statistically significant and only reduced the heterogeneity slightly to I^2 = 83%. One study did not report measures of variance for the BMI z score (Jiang 2005), and we imputed the SDs from another study. Removing this study from the meta-analysis reduced the effect size and reduced the 95% CIs; however, the direction of effect remained the same (MD -0.08 (95% CI -0.14 to -0.02); P = 0.007; 2331 participants; 19 studies; 21 comparisons) and reduced heterogeneity but remained considerable (I^2 = 70%).

The removal of cluster RCTs where it was unclear if the effect of clustering had been taken account of in the analysis (Grey 2009; Pbert 2013) from the BMI analysis increased the MD (MD -1.34 (95% CI -1.80 to -0.89); P < 0.00001; 26 studies; 32 comparisons; 2494 participants) but heterogeneity remained highly significant ($I^2 = 71\%$).

Assessment of reporting bias

We generated a funnel plot for the primary outcome of BMI as this analysis included the highest number of studies on which to assess publication bias. Inspection of the funnel plot suggested the possibility of a small-study bias (Figure 4).

Figure 4. Funnel plot of comparison: I Interventions (all) versus controls, longest follow-up, outcome: I.I BMI change (kg/m&supStart;2&supEnd;)

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 25 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Ongoing studies

We found 50 ongoing RCTs (see Characteristics of ongoing studies table). Forty-four of these RCTs are parallel trials, two are cluster trials, two are cross-over trials, one is a factorial trial and in one the design is unclear. Eight trials are three-arm trials and one is a fourarm trial. The ages of the participants in these trials incorporate the range of five to 18 years in 43 trials and are not clearly reported in seven trials. In one trial, the target population is classed as overweight according to Cole international cut-offs for child obesity, in 22 trials the target population are children classed as obese (using different methods), in 23 trials the population is described as overweight or obese and in four trials the classification is unclear. Six trials include a physical activity intervention, four trials include a nutritional intervention, three trials include dietary supplements, 19 trials include a behavioural intervention and 21 trials include a multicomponent intervention.

Thirty-four trials compare the intervention to usual care or no intervention, 12 compare to a concomitant therapy also delivered in the intervention arm, one trial compares to wait list control, two trials compare the intervention to placebo and in one trial the control is not clearly defined.

BMI was the primary outcome (BMI, BMI z score, BMI-SDS, BMI percentile) in 36 trials and secondary outcome in five trials. Weight change ass the primary outcome in four trials and the secondary outcome in one trial. Two trials did not state if weight change was the primary or secondary outcome and body composition (unclear what parameters) are the secondary outcome in one trial and other outcome in one trial. The estimated study completion dates, where reported, range from March 2011 to December 2021.

DISCUSSION

Summary of main results

This systematic review summarised 44 RCTs examining the effect of behaviour changing interventions for treating overweight and obesity in adolescents aged 12 to 17 years. We only included trials with at least a six-month outcome assessment with the aim of assessing the longer-term effects of these types of interventions. Interventions and comparators varied between the included trials. Outcomes assessed also varied between groups; although all trials reported a measure of body weight, the most commonly reported measures were BMI and BMI z score. To allow comparisons across trials, we analysed outcome data at the longest follow-up period. Many trials did not report adequate information to assess the risk of bias and 27 trials were at high risk of bias on at least one domain. Overall, behaviour changing interventions were more successful than the comparators in reducing BMI (low quality evidence), BMI z score (low quality evidence) and weight (moderate quality evidence) in overweight and or obese adolescents. The effects of behaviour changing interventions were maintained at 18 to 24 months' follow-up for both BMI and BMI z score.

There were subgroup differences showing larger effects for both BMI and BMI z score where comparison groups were described as no intervention/wait list control or usual care compared to those testing concomitant interventions delivered to both the intervention and control group (P = 0.008). There were no subgroup differences between interventions with and without parental involvement or by intervention type or setting (health care, community, school) or mode of delivery (individual versus group).

Adverse events were reported in only five trials (low quality evidence). Minor adverse events occurred in one four-arm study, but there were no details in the others.

Secondary outcomes were reported less consistently across trials. Overall, behaviour changing interventions were more successful than the comparators in reducing percentage of body fat, waist circumference and total fat mass. Fewer trials measured quality of life and self-esteem. Behaviour changing interventions improved quality of life at the longest follow-up period (low quality evidence) but not self-esteem.

Overall, trials measuring physical activity showed no improvement for objective and self-reported activity although evidence was limited. However, two trials reported improvement in physical activity self-efficacy at 12 months. Dietary intakes were inconsistently measured and reported across trials, and trials used different tools to assess dietary intake and reported outcomes using different units of measure. The majority of trials reported no substantial effect of behaviour changing interventions on dietary intake although again evidence was limited.

Overall completeness and applicability of evidence

This review identified 44 completed trials and 50 ongoing trials assessing the effect of diet, physical activity and behavioural interventions at six months or longer. The review included studies conducted in the US, Europe, Asia and the Middle East including participants of different ethnicity. Most trials included both genders except for two trials that were restricted to females and one trial was restricted to males. Over half of the trials followed the percentile range to diagnose overweight or obesity. The majority of interventions had a multidisciplinary approach which included

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 26 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. a combination of behavioural, dietary and physical activity components. Most trials reported details of the intervention that were mainly carried out for six months or less. The theoretical approach behind the intervention varied across studies with five studies using only the cognitive behavioural approach and four studies using only motivational interviewing. The majority of studies used either a mixture or other psychological theories (e.g. social cognitive theory, social learning theory, theory of planned behaviour) or did not have a theoretical approach behind the intervention. Only five trials used a mixed delivery approach (both individual and group mode) while the majority used either an individual or group delivery mode of the intervention. Studies were mainly conducted in healthcare settings while fewer trials were conducted in schools. All 44 trials reported measures of body weight but BMI and BMI z score were the commonly assessed outcomes. Adverse events were only reported in five trials and only one trial provided sufficient details of adverse events. Reports on quality of life, self-esteem, diet, physical activity, views of the intervention, and parenting and relationships were less consistent across trials. There was heterogeneity in measurement tools, assessed outcomes and unit of outcome measures. The duration of follow-up varied across trials with most trials reporting outcomes at six to nine months and fewer trials reporting outcomes at two years. Overall, behaviour changing interventions have a favourable effect on measures of body weight including BMI, BMI z score and weight change in adolescents. We found no results for our outcomes of morbidity, mortality or socioeconomic effects of intervention.

Quality of the evidence

We rated the quality of evidence for the outcomes of interest in this review as low with the exception of weight which was moderate (Summary of findings for the main comparison). We judged the risk of bias for many individual studies to be unclear or high for a number of domains, but we found the impact of bias on the results for BMI and weight outcomes to be limited due to the influence of low risk of bias studies in the analysis. For some outcomes where studies had high loss to follow-up, we saw a bigger effect size in sensitivity analyses. Anthropometric measures (BMI, BMI z score, weight) were downgraded for inconsistency (some variation in point estimates, poor overlap of CIs, significant statistical heterogeneity). Both BMI outcomes were downgraded further for indirectness due to the surrogacy of outcome measures (BMI and BMI z score). We maintained our decision to downgrade BMI outcomes for inconsistency even though we had some evidence that variation in effect could be explained by use of active controls in some studies. Within subgroup analysis heterogeneity remained high, indicating that there may be factors in addition to type of control intervention which give a credible explanation for inconsistency of effects across these outcomes.

Adverse events were downgraded due to risk of bias (inconsistency in reporting of data, reporting bias and attrition bias). Health-related quality of life was downgraded for risk of bias (lack of blinding of outcome assessors) and inconsistency (variability in point estimates, overlap in CI and significant statistical heterogeneity). Therefore, results should be interpreted with caution.

Potential biases in the review process

We included four cluster randomised trials in this review but did not adjusted the data to account for the unit of randomisation due to their limited influence on the review findings. While our approach risks introducing a unit of analysis error, the impact of this decision was questionable for the outcomes affected. Most information in our review came from studies which randomised participants rather than clusters. Sensitivity analyses restricted to individually randomised trials provided some indirect evidence that supported our approach. Given that the removal of cluster trials did not change the results, calculating effective sample sizes would reduce their weight in the analysis. Therefore, it is unlikely that the nature of the results would alter with less weight accorded to the cluster trials.

The large number of subgroup analyses in our review carries inherent risks of multiplicity and the statistically significant results for subgroup analyses we have found could simply reflect a chance finding. This should be borne in mind when considering the applicability of the results to decision-making. We conducted several other sensitivity analyses and found no significant differences. Where data of relevance were missing, either to allow assessment of eligibility, or at the data extraction stage and assessment of bias, we contacted the study authors for further information. Twelve trials are awaiting classification as information is currently unavailable to the review.

Agreements and disagreements with other studies or reviews

The UK National Institute for Health and Care Excellence (NICE) guidance emphasises the importance of behaviour changing weight management services in the treatment of overweight and obesity in young people under the age of 18 years (NICE 2013). However, the guidelines show that there is inconsistent evidence on the long-term effect of such interventions. The short-term effect of behaviour changing interventions on weight loss has been reported in a previous review (Wilfley 2007). Our results add to the evidence base and demonstrate that in trials with longer follow-up at 18 to 24 months, weight loss is maintained. Group-based interventions have been recommended by NICE and our review is consistent in that there were no differences between group-based and individually delivered interventions.

Overall the findings of our review are consistent with previous systematic reviews examining the effect of behaviour changing interventions for the treatment of childhood obesity (Kelly 2008;

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 27 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Ruotsalainen 2015; Whitlock 2010). Several reviews have guestioned the optimal length of behaviour changing interventions (Ho 2012; Kelly 2008; Wilfley 2007), we found that both shortterm interventions (less than six months) and long-term interventions (greater than six months) have a favourable effect on BMI, although in subgroup analyses longer interventions seemed to produce a greater effect on BMI. We found inconsistent evidence on the effect of behaviour changing interventions on dietary intake as reported by one previous systematic review (Collins 2006). One previous review reported the beneficial effect of physical activity on quality of life (Penedo 2005), we found similar favourable effect of behaviour changing interventions on quality of life but not selfesteem. The current review synthesises the most up-to-date and highest-quality research available on the effectiveness of different types of behaviour changing interventions for treating overweight or obesity in adolescents aged 12 to 17 years on a large range of outcomes. Future updates will incorporate the large number of ongoing trials which may strengthen this evidence base.

AUTHORS' CONCLUSIONS

Implications for practice

We explored the impact of different types of behaviour changing interventions on adolescents being overweight and obese. Overall, there is low-to-moderate quality evidence that behaviour changing interventions reduce measures of body weight including BMI, BMI z score and weight change in adolescents. Additionally, lifestyle interventions seem to reduce indicators of adiposity such as percentage of body fat, waist circumference and total fat mass. There is low quality evidence that behaviour changing interventions have a moderate effect on health-related quality of life. There is inconclusive evidence on the effects of behaviour changing interventions on self-esteem, dietary intake and physical activity in adolescents. Most of the evidence is from multicomponent interventions which include a combination of behavioural, dietary and physical activity interventions. We found no subgroup differences for type of intervention, behavioural approach, mode of delivery or setting. Similar levels of weight reduction are seen in trials with longer follow-up periods of up to two years suggesting that weight loss is maintained in these studies. However, the results of this review should be interpreted with caution as most of the evidence was rated as low quality due to inconsistency, indirectness or risk of bias for many of the outcomes measured. The risk of adverse events could not be assessed reliably as they were not measured by most of the trials.

Implications for research

This systematic review identified 50 ongoing trials of behaviour changing interventions targeting adolescent overweight and obesity and incorporation of the results of these when they become available may strengthen the evidence base. Further research is required to determine whether the interventions have any adverse effects. Economic data are needed and trials reporting the costs of behaviour changing interventions should be measured and reported. Consistent measures of health-related quality of life, self-esteem, dietary and physical activity outcomes using validated tools should be used in future research and reports should provide adequate and transparent methodological details such as allocation concealment, blinding, attrition, selective reporting and validity of tools. Higher quality trials are required as the current evidence is of low methodological quality.

ACKNOWLEDGEMENTS

NCT00940966. A pilot study to determine the efficacy of a low carbohydrate diet in treatment of adolescents with metabolic syndrome. clinicaltrials.gov/ct2/show/ NCT00940966 Date first received: 15 July 2009.

NCT00998413 {published data only}

NCT00998413. Weight-reduction intervention in asthmatic children with overweight/obesity. clinicaltrials.gov/ct2/show/NCT00998413 Date first received: 19 October 2009.

Willeboordse M, van de Kant KD, de Laat MN, van Schayck OC, Mulkens S, Dompeling E. Multifactorial intervention for children with asthma and overweight (Mikado): study design of a randomised controlled trial. *BMC Public Health* 2013;**13**:494. DOI: 10.1186/1471-2458-13-494

NCT01023139 {published data only}

NCT01023139. Efficacy in adolescents of continued behavior modification following a six month sibutraminebased weight management intervention (AOS). clinicaltrials.gov/ct2/show/NCT01023139 Date first received: 1 December 2009.

NCT01221220 {published data only}

NCT01221220. Environmental strategies & behavior change to reduce overeating in obese children. clinicaltrials.gov/ct2/show/NCT01221220 Date first received: 13 October 2010.

NCT01350531 {published data only}

NCT01350531. Interventionist procedures for adherence to weight loss recommendations in black adolescents. clinicaltrials.gov/ct2/show/NCT01350531 Date first received: 21 April 2011.

NCT01374386 {published data only}

NCT01374386. Impact of Exergaming on adolescent youth. clinicaltrials.gov/ct2/show/NCT01374386 Date first received: 14 June 2011.

NCT01448551 {published data only}

NCT01448551. MPOWERed messages: tailored mobile messages to enhance weight loss for teens. clinicaltrials.gov/ ct2/show/NCT01448551 Date first received: 5 October 2011.

NCT01456221 {published data only}

NCT01456221. Intervention study with omega-3 fatty acids for weight loss and insulin resistance in adolescents (O3WLIRADOL). clinicaltrials.gov/ct2/show/ NCT01456221 Date first received: 12 October 2011.

NCT01514279 {published data only}

NCT01514279. Ideas moving parents and adolescents to change together (IMPACT). clinicaltrials.gov/ct2/show/ NCT01514279 Date first received: 20 December 2011.

NCT01677923 {published data only}

NCT01677923. Obesity in children and adolescents: associated risks and early intervention (OCA). clinicaltrials.gov/ct2/show/NCT01677923 Date first received: 30 July 2012.

NCT01688453 {published data only}

NCT01688453. Overweight management and social inequalities (PRALIMAP-INES). clinicaltrials.gov/ct2/ show/NCT01688453 Date first received: 7 September 2012.

NCT01764113 {published data only}

NCT01764113. Effect of mindful eating on body mass index in obese adolescents. clinicaltrials.gov/ct2/show/ NCT01764113 Date first received: 7 January 2013.

NCT01794546 {published data only}

NCT01794546. Integrated care for pediatric obesity using telehealth. clinicaltrials.gov/ct2/show/NCT01794546 Date first received: 15 February 2013.

NCT01796067 {published data only}

NCT01796067. Families improving together (FIT) for weight loss. clinicaltrials.gov/ct2/show/NCT01796067 Date first received: 22 January 2013.

CHARACTERISTICS OF STUDIES

Characteristics of included studies [ordered by study ID]

Bean 2014

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : aged 11-18 years; BMI \geq 85th percentile for age and gender (CDC 2000); parent willing to participate; an identified primary care physician; no underlying medical condition which would preclude weight loss through behavioural intervention Exclusion criteria : - Diagnostic criteria : as above
Interventions	 Number of study centres: one Treatment before study: all participants had been enrolled in the TEENS RCT. Parents attended biweekly groups. Participants met on alternating weeks with a dietitian and behavioural support specialist for 6 months. Supervised physical activity at least 3 times per week Description of interventions MI Values : 3 main components of TEENS family-based intervention are physical activity, dietary intervention and behaviour support. MI Values targets adolescents alone to enhance autonomy for change. 2 × 30-minute sessions at weeks 1 and 10. Trained interventionists were independent of TEENS. Participants selected target behaviours and included TEENS participation, diet, exercise or a combination. Session 1 included a values clarification exercise, session 2, explored progress in TEENS, re-examined value/ behaviour congruency and elicited participant ideas for change Education control : 30-minute videos focused on healthy eating and exercise for adolescents at weeks 1 and 10. Participants complete a knowledge quiz to ensure treatment adherence All participants proceeded with TEENS multidisciplinary obesity treatment programme as usual
Outcomes	Outcomes reported in abstract of publication: adherence (overall, dietitian visits, behavioural support visits)
Study details	Run-in period: none Study terminated early: no Trial identifier: NCT00167830
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "to investigate if brief (two-session) MI can enhance treatment effects among adolescents with obesity enrolled in a multidisciplinary treatment [the T. E.E.N.S. (Teaching Encouragement Exercise Nutrition Support) Program]."
Notes	Implemented within the TEENS programme. Publication reported no eligible outcomes

Risk of bias

Risk of bias		
Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote from publication: "participants are randomized to treatment condition using a random number generator" Comment: appropriate
Allocation concealment (selection bias)	Unclear risk	Comment: no details
Blinding of participants and personnel (performance bias) Objective outcomes	High risk	Quote from publication: "T.E.E.N.S. in- terventionists (dietitian and behavioral support specialists) are blind to participant treatment condition" Comment: suggests that the MI interven- tionists were unblinded
Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Comment: no details but low risk of bias for objective outcomes
Incomplete outcome data (attrition bias) Objective outcomes	Unclear risk	Quote from publication: "Ninety-nine par- ticipants were randomized and completed baseline assessments" Comment: no details of numbers ran- domised who did not complete baseline as- sessments
Selective reporting (reporting bias)	Unclear risk	Comment: limited outcomes published to date, study reports that BMI-percentile to be published
Other bias	Unclear risk	Comment: trial reported no data and it was unclear if they tested for interaction

Boodai 2014

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	 Inclusion criteria: aged 10-14 years, obese (BMI) > 95th percentile, have at least 1 parent who expressed a willingness to attend the intervention, no serious underlying medical condition that might be either a cause or consequence of their obesity Exclusion criteria: non-obese, major disease, underlying pathological cause of obesity, aged < 10 years or > 14 years at study inception, not attending a mainstream school in the public sector, unable or unwilling to attend treatment sessions if randomised to intervention group Diagnostic criteria: as above

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 44 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Boodai 2014 (Continued)

Interventions	Number of study centres: one Treatment before study: none Description of interventions Low-intensity group programme : 6 sessions of 1 hour. Delivered by a physician with specialist training in nutrition and a dietitian. Programme adapted from the Scottish Childhood Obesity Treatment Trial. Treatment materials were provided. Sessions focused on changing behaviours such as reduction in sedentary behaviour (screen-media use); diet (used a modified 'traffic light diet' reference given); promotion of physical activity Theoretically based on behaviour change techniques to all 3 of the targeted behaviours (including self-monitoring of sedentary behaviour; identifying the main barriers to be- haviour change; problem solving; goal setting; relapse prevention). Ideally at least 1 par- ent should have been present The intervention group split into boys (n = 21) and girls (n = 20) in accordance with cultural norms of Kuwait. Sessions were delivered on 2 consecutive days Control : informed that they were obese and advised to attend primary care
Outcomes	Outcomes reported in abstract of publication: BMI z score
Study details	Run-in period: none Study terminated early: no
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal Trial identifier: ISRCTN37457227
Stated aim for study	Quote from publication: "to test the hypothesis that a 'good practice' intervention for the treatment of adolescent obesity in Kuwait would have a greater effect on primary and secondary outcomes than allocation to a control group. The secondary aims were to test the feasibility of conducting such a trial in Kuwait and to test the feasibility of using a good practice intervention and referral to primary care as a control condition."

Notes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Quote from publication: "computer gener- ated randomisation list that allocated par- ticipants to intervention or control group, with participants balanced for gender in blocks of 10." Comment: appropriate
Allocation concealment (selection bias)	Low risk	Quote from publication: "participants as- signed a unique study code prior to random allocation To ensure concealment of al-

Boodai 2014 (Continued)

		location, codes were sent electronically to a statistician (JHM) who produced a com- puter generated randomisation list." Comment: appropriate
Blinding of participants and personnel (performance bias) Objective outcomes	High risk	Quote from publication: "The statistician informed the researcher responsible for de- livering the intervention (SAB) of the allo- cation, and families were invited to inter- vention or control groups as appropriate." Comment: investigator-assessed
Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Quote from publication: "Outcome mea- sures were made by the same trained re- search assistants who were blinded to group allocation and were not involved in deliv- ery of the treatment intervention." Comment: investigator-assessed
Incomplete outcome data (attrition bias) Objective outcomes	Unclear risk	Quote from publication: "The analysis was intention-to-treat, where we used data from all adolescents for whom data were available on the basis of the group to which they were allocated, regardless of their adherence to the protocol (attendance)." Comment: reported and reasons explained ITT is a modified ITT as only those who had data were included
Selective reporting (reporting bias)	High risk	Comment: quality of life, blood lipids, fat- mass and fat-free mass not reported
Other bias	Unclear risk	Comment: no participants in the control arm attended primary care and received the intervention

Brennan 2013

Methods	Cross-over RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria: aged 11-19 years, overweight or obese according to the international cut-off points for BMI in children, living with a parent or adult carer who was prepared to be involved in treatment Exclusion criteria: had an intellectual or physical disability that prevented them from participating in the programme Diagnostic criteria: as above

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 46 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Interventions	Number of study centres: 2 Treatment before study: none Description of interventions M : individual sessions aimed at improving body composition, cardiovascular fitness, im- prove eating habits, physical activity habits and promote positive psychosocial function- ing by moving participants closer to the Australian recommendations. The programme aimed to instigate small maintainable improvements. Theoretical basis Sessions included a review of the previous session, discussion of homework, goal achieve- ment and monitoring; discussion, questions and practice of strategies; setting of exer- cises for the session and assisted with setting goals; summary of the session material and setting of home practice tasks. Adolescents were then given the choice of attending the remaining sessions alone, or with the support of a parent. 12 sessions over 4-6 months (psycho-education; eating behaviour; physical activity; healthy food choices; exercise; behaviour charts and barriers; recognising thoughts and emotions; helpful thoughts and
	 emotions; assertive communication; problem solving and planning; staying on track; maintenance and closure). Between session 11 and 12 had a telephone call, maintaining change. Weekly sessions for the first 10 weeks Parents and adolescents received a programme workbook. Between sessions, adolescents were encouraged to monitor their behaviour change goals and record their eating and physical activity habits. The physical activity component aimed to promote physical activity habits consistent with guidelines recommending at least 60 minutes of moderate-to-vigorous physical activity per day and no more than 2 hours per day in noneducational screen activities. Rather than specifying goals in terms of specific caloric intake or expenditure targets, aimed to move participants closer to recommendations for eating such as consumption of a variety of foods from each of the 5 food groups (cereals, vegetables, fruit, diary, and meat products and alternatives), the selection of lowfat alternatives, and the consumption of water Parental support: provided with written session materials for sessions 7 (strengthening parent adolescent relationship), 8 (encouraging appropriate behaviour) and 9 (discouraging inappropriate behaviour) Maintenance phase: while the control group given the intervention telephone call sessions were completed every second week and a face-to-face session at 3 months which was followed by monthly telephone call session and a final face-to-face session conducted at 6 months Researcher received training in MI Control : wait list control - offered the intervention after 6 months (postintervention)
Outcomes	Outcomes reported in abstract of publication : weight control behaviour, impulse regulation, social support from family and parent-adolescent problem communication, treatment acceptability, body composition (body fat, % body fat, lean mass) and anthropometric measures (weight, BMI, BMI-for-age z score and percentiles), cardiovascular fitness
Study details	Run-in period: none Study terminated early: no Trial identifier: ACTRN12610000111077

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 47 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Brennan 2013 (Continued)

Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "evaluate the efficacy of the CHOOSE HEALTH program, a family based cognitive behavioural lifestyle program targeting improved eating and activity habits, in improving body composition, cardiovascular fitness, eating and activity behaviours in overweight and obese adolescents; 2) to explore the impact of The CHOOSE HEALTH Program on psychosocial wellbeing in overweight and obese adolescents."
Notes	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote from publication: "After completing all assessments, participants were asked to select a number between 1 and 3 and the selected number was compared to an inves- tigator randomly selected number, which was then used to allocate the participant to the treatment or control condition." Comment: unclear how the investigator number was randomly selected or how the combination of these 2 elements produced an allocation
Allocation concealment (selection bias)	Unclear risk	Comment: no details
Blinding of participants and personnel (performance bias) Subjective outcomes	Unclear risk	Comment: no details. The reliance on self- report data to measure psychosocial factors, and the use of indirect self-report measures of physical activity and energy intake, may result in self-report biases
Blinding of participants and personnel (performance bias) Objective outcomes	Unclear risk	Comment: no details
Blinding of outcome assessment (detection bias) Subjective outcomes	Low risk	Quote from publication: "Assessors and ob- servers were blind to participant's group allocation, treatment adherence, and stage of intervention. The treating clinician was not involved in physical assessment ses- sions. The analysis of all monitoring data was completed by an independent research

Brennan 2013 (Continued)

		assistant who was blind to treatment stage and condition." Comment: appropriate
Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Quote from publication: "Assessors and ob- servers were blind to participant's group allocation, treatment adherence, and stage of intervention. The treating clinician was not involved in physical assessment ses- sions. The analysis of all monitoring data was completed by an independent research assistant who was blind to treatment stage and condition." Comment: appropriate
Incomplete outcome data (attrition bias) Subjective outcomes	Low risk	Comment: reasons for dropout unclear. Intervention group was larger and had a higher % of dropouts compared to the con- trol group. Complete valid data were not available for all measures or participants. It is possible that the non-completers differed from the completers in important ways and consequently results were not representa- tive of those obtained had the entire sample completed all assessments. ITT was used with first value carried forward method
Incomplete outcome data (attrition bias) Objective outcomes	Low risk	Comment: reasons for dropout unclear. Intervention group was larger and had a higher % of dropouts compared to the con- trol group. Complete valid data were not available for all measures or participants. It is possible that the non-completers differed from the completers in important ways and consequently results were not representa- tive of those obtained had the entire sample completed all assessments. ITT was used with first value carried forward method
Selective reporting (reporting bias)	High risk	Comment: psychosocial outcomes not published
Other bias	Unclear risk	Comment: the lead author was both the clinician and evaluator which may result in an evaluator bias

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 49 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. Brownell 1983

Methods	Parallel RCT, randomisation ratio: 1:1:1, superiority design		
Participants	Inclusion criteria : aged 12-16, \geq 20% mean weight for age, gender and height; free of medical conditions or medications that would influence body weight, not involved in other formal weight loss programmes, able to attend all sessions with their mothers. Mothers could be any weight Exclusion criteria : - Diagnostic criteria : -		
Interventions	Number of study centres: 1 Treatment before study: - Description of interventions Programme of behaviour modification, nutrition education, exercise instruction and social support, described in a treatment manual. 16 weekly sessions 45- to 60-minutes' duration, groups of 5-8. Discussed the week's didactic material and matters such as feelings about being overweight, family difficulties and food preparation Follow-up sessions every 2 months during 1-year maintenance period Each parent deposited USD15: USD10 refunded if all treatment sessions were attended, and USD5 refunded for attendance at follow-up meetings. Mothers also paid USD3 fee before each meeting. As an incentive, each child deposited USD8 at the start of each month during treatment; USD2 was returned to the child each week ≥ 1 lb was lost Trainer was a Masters level psychologist and a Doctoral level psychologist Mother-child separately : mothers and children met concurrently in separate groups Mother-child together : attended all treatment sessions and met together in the same group Child alone : children met in groups, but the mothers did not take part in the formal treatment programme		
Outcomes	Outcomes reported in abstract of publication: weight loss, blood pressure		
Study details	Run-in period: orientation session prior to programme Study terminated early: no Trial identifier: -		
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal		
Stated aim for study	Quote from publication: "to test three methods of parent involvement in the treatment of obese adolescents aged 12 to 16 years. Short-term and long-term changes in weight and blood pressure were assessed."

Random sequence generation (selection bias)	Unclear risk	Quote from publication: "assigned ran- domly from stratified blocks." Comment: method of randomisation not stated
Allocation concealment (selection bias)	Unclear risk	Comment: not reported
Blinding of participants and personnel (performance bias) Objective outcomes	Unclear risk	Comment: not reported
Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Comment: not reported but low risk of bias from objective outcomes
Incomplete outcome data (attrition bias) Objective outcomes	Unclear risk	Comment: missing data reported but rea- sons not explained
Selective reporting (reporting bias)	Unclear risk	Comment: outcomes reported as in meth- ods, but protocol not available
Other bias	Low risk	Comment: no other bias

Carraway 2014

Methods	Parallel RCT, randomisation ratio: -, superiority design
Participants	Inclusion criteria : male and female adolescents aged 12-17 years, who were at or above the 85th percentile for BMI based on age and gender, willing and able to complete 3 sets of physical and questionnaire assessments (at baseline, postintervention and follow-up), come to the gym 3 times per week to exercise with their assigned mentor for the duration of 3 months Exclusion criteria : - Diagnostic criteria : as above
Interventions	Number of study centres: 1 Treatment before study: none Description of interventions Mentor : mentor-led exercise programme Control : wait list control
Outcomes	Outcomes reported in abstract of publication: perceived athletic competence, physical activity, social anxiety, social support
Study details	Run-in period: none Study terminated early: no

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 51 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Carraway 2014 (Continued)

Publication details	Language of publication: English Unclear funding Publication status: unpublished thesis Trial identifier: -
Stated aim for study	Quote from publication: "the purpose of the current pilot study was to assess whether adding a group-based component to increase problem-solving skills, communication skills, parental social support, and problem-focused coping with teasing as a part of a mentor-led exercise intervention (MENTOR+CBT) would decrease social avoidance, improve social support, and increase perceived competence for physical activity as well as physical activity level in obese adolescents beyond the effects of mentor-led exercise alone (MENTOR only)."
Notes	Relevant for this review is MENTOR only vs wait list control. The second cohort examining MENTOR + CBT are not randomised. Contacted author (17 January 2017) for stratified outcomes and risk of bias

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No details
Allocation concealment (selection bias)	Unclear risk	No details

Carrel 2005

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria: BMI > 95th percentile for age Exclusion criteria: - Diagnostic criteria: as above
Interventions	 Number of study centres: unclear Treatment before study: none Description of interventions Behaviour changing-focused, fitness-oriented gym classes : class size limited to 14 students to allow for increased instructor attention, increased opportunity for motivation and less time standing in line. The curriculum was personalised to match the student's skill levels and encourage student participation. Competitive games were de-emphasised, and behaviour changing focused activities (walking, cycling and snowshoeing) were encouraged. A consistent warm-up plan brought students into movement participation as quickly as possible soon after they entered the gym. Typical movement time was 42 minutes of a 45-minute class period, as children did not change clothes for this class to increase activity time. Skills were taught with the class broken down into groups of 2 for promoting more movement and less time watching. The ethos of the class encouraged physical fitness, less self-conscious focus on appearance and full group participation. Training for instructors not stated Standard gym classes : movement time averaged 25 minutes of the 45-minute period. Participated in the traditional physical education classes of 35-40 students. The same class topics (e.g. football, mile run/walk, kickball) were taught as in the intervention group, but in a different format, as typical issues in the traditional class were a greater range of skill levels, longer lines during skill development drills and larger numbers of students on teams when games were played. These issues tended to result in less movement and a tendency for students to hold back and not enter into play For both groups: 36-week (9-month) intervention, 90 sessions. The frequency of classes was 5 times every 2 weeks for a 45-minute class period. All received a small nutrition education component. This consisted of educational handouts to participants to develop healthier eating habits. The nutrition portion focuses on the Food G

Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Comment : nothing stated, objective out- comes unlikely to be affected by lack of blinding
Incomplete outcome data (attrition bias) Objective outcomes	Unclear risk	Comment: unclear why the sample fell from 43 to 35 at 3 and 7 months
Selective reporting (reporting bias)	Unclear risk	Comment : only mean weight loss reported
Other bias	Low risk	Comment : no other bias

Christie 2011

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design	
Participants	Inclusion criteria : aged 13-17 years living in Greater London, UK, Obese defined as BMI > 98th centile for BMI using the UK 1990 growth reference Exclusion criteria : significant mental health problems; chronic illness (asthma permitted as long has not more than 1 course of oral steroids in preceding 3 months or on 2nd dose or more of inhaled steroids); known secondary obesity, monogenic obesity syndrome or use of medications known to promote obesity; significant learning disability; insufficient command of English language; previous participation in behavioural weight management programmes in the past 12 months (excluding commercial programmes such as Weight Watchers); BMI \geq 40 kg/m ² Diagnostic criteria : as above	
Interventions	 Number of study centres: 1 Treatment before study: none Description of interventions HELP : a solution-focused and motivational weight management programme based on national guidelines. Young people and families attended 12 × 40- to 45-minute sessions over 6 months. 4 components: modifying eating behaviours and encouraging regular eating patterns; decreasing sedentary behaviour and increasing behaviour changing and programme activity; reducing intake of energy dense foods, and increasing healthy nutritional choices; addressing emotional eating triggers. Providers (trained Graduate Health Workers) received training in specific MI techniques and use of solution-focused questioning. Used manual to enable delivery in a standardised manner by all the providers Control : enhanced standard care, 1 prewritten standardised educational session delivered to young people within 3 months of recruitment by a practice nurse. The session lasted 40 minutes (although the abstract stated 2 hours) and incorporated standard national guidance and published information on obesity, addressing eating behaviours, healthy activity levels and healthy eating patterns. No training in delivery style offered Recruitment compensation: all participants received a voucher (GBP20) and travel costs

Daley 2005 (Continued)

	warm up, 4 minutes' moderate intensity at 40-59% heart rate reserve, 2 minutes' rest between each bout), 3 times per week for 8 weeks. Mini games also included A GBP25 sports store voucher was given to participants at the end of the intervention phase, and a contribution of GBP2.50 toward travel expenses to attend intervention sessions and assessments was made for each visit to the trial centre. An additional GBP10 sports store voucher was given to participants when they completed their final follow- up assessment Training of interventionists not reported Exercise placebo : 24 sessions over 8 weeks; performed light body-conditioning/stretch- ing exercises, during which heart rate was maintained at 40% of heart rate reserve, and no exercise counselling or behavioural change advice was given. Also, participated in other sedentary activities, such as balance and catching tasks, pool, darts and table football Control : usual care group continued with their lives as usual; were given the opportunity to complete exercise sessions at the centre once they had completed the study
Outcomes	Outcomes reported in abstract of publication : Children's Depression Inventory score, physical self-worth, self-esteem, and physical activity over time, BMI
Study details	Run-in period: none Study terminated early: no Trial identifier: ISRCTN83888112
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "The primary aim of SHOT [SHeffield Obesity Trial] is to examine the effects of a supervised exercise therapy intervention in young people who are obese."
Notes	For the purpose of the review, we combined the exercise placebo group and control group as the exercise placebo was not intended to promote weight loss and was therefore considered to be a no treatment comparator

Debar 2012 (Continued)

	 Primary care-based multicomponent behaviour changing intervention : 90-minute group sessions over 5 months. Addressed issues associated with obesity in adolescent girls (e.g. depression, disordered eating patterns, poor body image). Session included reviewing goals and problem solving to overcome barriers and challenges to increased activity, discussion of topics particularly pertinent to adolescent girls and specific behavioural and cognitive tools for coping, including: self-monitoring of dietary intake, physical activity and screen time; stimulus control and environmental changes, stepwise goal-setting and problem solving; setting goals for increasing pleasant activities; cognitive restructuring techniques to combat negative self-talk. Groups met 16 times, weekly for 3 months and biweekly during months 4 and 5 Increasing physical activity was promoted by using tailored forms of exercise (e.g. exergaming), goals included 30-60 minutes of physical activity at least 5 days per week; 15 minutes of daily yoga (provided with training in safe and basic yoga practices, equipment, an instructional booklet and CD), limiting screen time to 2 hours per day; and increasing "found exercise" opportunities whenever possible. Core activities chosen to overcome obstacles such as embarrassment. Participants provided with exergaming equipment (details provided). Also, strategies for increasing physical activity (e.g. pedometers, resistance bands) promoted Dietary intake and eating patterns followed caloric guidelines (1600- 1800 kcal daily), and 3 main areas for dietary change emphasised: decreasing portion sizes, limiting consumption of energy dense foods and increasing consumption of lower energy-dense foods. Other dietary strategies also covered Parents had 12 separate weekly group sessions in the first 3 months. Nutritional and physical activity principles the teens would learn discussed, encouraged to increase or maintain the frequency of family meals Paediatric providers receiv

Ebbeling 2012		
Methods	Parallel RCT, randomisation ratio: 1:1, superiority design	
Participants	Inclusion criteria : grade 9 or 10 and BMI \geq 85th percentile for gender and age, aged 13-18 years, reported consuming \geq 1 serving (i.e. 360 mL or 12 fluid ounces) per day of sugar-sweetened beverages (i.e. soft drinks, juice drinks containing < 100% juice, punches, lemonades, iced teas and sports drinks). Each participant lived predominantly in 1 household (i.e. no more than 1 weekend every 2 weeks in a secondary household) Exclusion criteria : dieting for the purpose of weight loss or taking prescription medications that might affect body weight, reported smoking \geq 1 cigarette in the past week or diagnosed as having a major medical illness or eating disorder, BMI < 25th percentile Diagnostic criteria : as above	
Interventions	 Diagnostic criteria: as above Number of study centres: - Treatment before study: none Description of interventions Multicomponent intervention : designed to reduce consumption of sugar-sweetened beverages. Emphasis on displacing sugar-sweetened beverages with non-caloric beverages in the home as a strategy to decrease consumption Home delivery of non-caloric beverages (e.g. bottled water and 'diet' beverages) every 2 weeks. Written intervention messages with instructions to drink the delivered bev- erages and not to buy or drink sugar-sweetened beverages were mailed to participants. Unsweetened water was recommended over artificially sweetened beverages Discussions during telephone calls and check-in visits focused exclusively on beverage consumption, with no attention to other dietary behaviours or to physical activity 3 check-in visits with participants (20 minutes per visit). Monthly motivational telephone calls with parents (30 minutes per call). Home delivery of non-caloric beverages (e.g. bottled water and 'diet' beverages) every 2 weeks At 6 months (pilot study), each participant received a USD100 gift certificate to a local shopping mall at the end of the study. Control group received weekly home deliveries of non-caloric beverages for 4 weeks after completion of follow-up measurements. At 1 year, control group received USD50 supermarket gift cards at 4 and 8 months but did not receive instructions on what to purchase with the cards Groups were led by dieticians, Master's level therapists, psychologists or psychiatrists. Staff were trained Control: no details 	
Outcomes	Outcomes reported in abstract of publication : consumption of sugar-sweetened bev- erages, BMI, weight, change in body fat as % body weight

Ford 2010

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : aged 9 to < 18 years, BMI > 95th centile, minimal or no learning difficulties, no underlying medical problem, no medication for insulin resistance Exclusion criteria : - Diagnostic criteria : BMI > 95th centile
Interventions	 Number of study centres: 1 Treatment before study: - Titration period: - Description of interventions Mandometer group : computerised device providing real-time feedback during meals to slow down speed of eating and reduce total intake. Saw a research nurse trained in use of Mandometer once per week for 6 weeks, every second week for a further 6 weeks, and once every 6th week thereafter. Research nurse telephoned support and encouragement every second week from week 12 onwards. Participants were trained in the use of Mandometer including test meals, setting of training lines and eating speed. Dietary advice by a paediatric dietitian 4 times over 12 months based on the UK Food Standards Agency 'eatwell plate' educational tool. Clinician met the participants every 4 months, emphasising the need to change eating habits and improve physical activity as advocated in the standard clinic Standard care controls : initial 1-hour discussion about reasons for, and implications of, obesity and behaviour changing measures that may improve BMI Multidisciplinary team composed of a clinician, paediatric dietitian and exercise specialist. Emphasis placed on implementing changes to increase levels of enjoyable physical activity to national recommended levels (60 minutes of exercise per day) alongside a balanced diet, based on the 'eatwell plate'. Set their own dietary goals and targets, with practical advice and guidance from the dietician, facilitation to exercise rather than prescription. MI techniques used to engage participants and families in the decision-making process for changes in behaviour. Appointments at 3-monthly intervals

Grey 2009

Methods	Cluster RCT, randomisation ratio: 2:1, superiority design
Participants	Inclusion criteria: in 7th grade, BMI > 85th percentile, family history of type 2 diabetes mellitus, parents who were English or Spanish speaking, no other major health problems Exclusion criteria: - Diagnostic criteria: as above
Interventions	Number of study centres: 6 Treatment before study: none Description of interventions CST : nutrition and exercise educational content enhanced by the inclusion of CST, based on Bandura's social learning theory). To increase students' sense of competence and mastery, open discussion and questions and answers about events occurring in the past week with which the youth had difficulty, youth role-playing common situations, practicing new coping skills. Encouragement and reinforcement provided by other stu- dents and teacher. Materials developed by a clinical psychologist who was an expert in CST 13 sessions over 16 weeks. No mention of length of sessions: 8 nutrition and activity classes + 5 coping skill training (Getting to know you; Change in actions; Get up and move; Stress identification and reduction; Aim for life skills; Healthy lifestyle tic-tac-toe; Resolving conflict and effective communication; What's on your plate?; Size up your portions; What's in a food label?; Eating in a fast food world; How to "go out" without guilt; Recipe makeover) Physical activity component focused on reducing leisure time sedentary behaviours that may compete with activity, learned creative ways to increase physical activity in a non- structured exercise programme, including culturally relevant approaches, such as aerobic dancing Materials developed by a registered dietitian. A non-diet, family centred approach used as nutrition education component. Major dietary goal was to provide highest nutritional quality for lowest caloric intake. Emphasis placed on lowering dietary fat intake to < 30%, improving food and drink choices, and decreasing total calories by focusing on appropriate portion sizes, while including culturally specific foods and being sensitive to the costs of foods

Grey 2009 (Continued)

	Health coaching provided only to participants in intervention group, commencing at end of 16-week intervention programme, and lasting until the 12-month data collection - 9 months of weekly 5- to 10-minute telephone health coaching provided by an advanced practice nurse, nutritionist, family therapist or psychologist, on a rotating basis Teachers in schools trained by study staff to deliver intervention. Students compensated for their time with a small token (toy worth USD5-10) following data collection General education : 8 sessions in 16 weeks. Intervention component: Get up and move; Healthy lifestyle tic-tac-toe; What's on your plate?; Size up your portions; What's in a food label?; Eating in a fast food world; How to "go out" without guilt; Recipe makeover. Physical activity and nutritional component as above
Outcomes	Outcomes reported in abstract of publication: anthropometric measures, lipids, de- pressive symptoms, BMI
Study details	Run-in period: none Study terminated early: no Trial identifier: -
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "To evaluate the impact of a multifaceted, school-based in- tervention on inner city youth at high risk for type 2 diabetes mellitus (T2DM) and to determine whether the addition of coping skills training (CST) and health coaching improves outcomes."

Notes

Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Quote from publication: "The randomi- sation could not be blinded to the re- searcher and participants." Comment: adjudicated/investigator- assessed, outcome assessor not blinded but unlikely to be at risk of bias
Incomplete outcome data (attrition bias) Subjective outcomes	Unclear risk	Quote from publication: "numbers and reasons explained. No ITT analysis for sub- jective outcomes" Comment: unclear
Incomplete outcome data (attrition bias) Objective outcomes	Low risk	Quote from publication: "all participants were analyzed in the group to which they were randomly assigned" Comment: reported and reasons explained
Selective reporting (reporting bias)	High risk	Comment : physical activity and sedentary behaviour not reported
Other bias	Low risk	Comment : no other bias noted

Jelalian 2016

Methods	Parallel RCT, randomisation ratio: 2:1, superiority design
Participants	Inclusion criteria : 12- to 18-years-old, Diagnostic and Statistical Manual of Mental Disorders criteria for current major depressive episode or dysthymia; Clinical Depression Severity Rating Scale (CDRS) score ≥ 65 ; BMI > 25 kg/m ² or BMI percentile ≥ 85 th percentile for gender and age; and parent or carer willing to participate Exclusion criteria : without reliable transportation; taking weight-altering medications within 6 months prior to study initiation; unable to do moderate-to-vigorous physical activity; weighing > 300 lb; in foster care; receiving special needs education; previous participant in study authors' weight loss studies; currently enrolled in a weight loss programme; diagnosed with obesity-related disorders; requiring immediate weight loss management or diseases affecting absorption or processing of nutrients Diagnostic criteria : as above
Interventions	Description of interventions CBT for depression and healthy lifestyle + exercise : individual CBT treatment adapted into 1 integrated protocol that addressed depression, exercise component, weight and advice regarding healthy eating. Weekly 60-minute group aerobic exercise sessions were required and facilitated by a physiotherapist. Individual meetings with a nutritionist

Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Quote from author: "research assistants were blinded to condition." Comment: not reported
Incomplete outcome data (attrition bias) Subjective outcomes	High risk	Comment: only report number of participants reporting positive views of the intervention
Incomplete outcome data (attrition bias) Objective outcomes	High risk	Comment: numbers reported and reasons explained. Authors mentioned ITT but presented completers outcomes only. High attrition rate; however, this was a pilot study
Selective reporting (reporting bias)	Low risk	Comment : reported all outcomes
Other bias	Low risk	Comment : no other bias noted

Jiang 2005

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design	
Participants	Inclusion criteria: grades, defined as weight-for-height ≥ 120% of the Chinese reference Exclusion criteria: - Diagnostic criteria: as above	
Interventions	Number of study centres: 1 Treatment before study: none Description of interventions Family-based behavioural treatment : 104 weeks (2 years). Unclear how many sessions. Focused on dietary behaviour modification, 1 or 2 main behaviours which were related to obesity were chosen for each child based on an assessment of relevant dietary and exercise patterns at baseline. Then a new goal behaviour and interval behaviours were defined. Each goal and interval behaviour was discussed with the child and the parents and was agreed to by the child. A diary was kept by the children on their behaviour to monitor adherence to the recommended lifestyle changes. The parents monitored the diary and their child's progress in achieving the new behaviours Paediatricians (researchers) visited the families once per month to observe the family environment, look for where foods were stored, cooking styles and what types of foods were used commonly in the family. The behavioural diary was checked and gaps in the recordings were discussed. Potential methods of reinforcement and penalty were also discussed with the parents and children during home visits. A 'traffic light' food item list was provided to help decrease energy intake and promote a balanced diet: 'red light' foods

Kong 2013

Methods	Cluster RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : 9th-11th grade, BMI \geq 85th percentile Exclusion criteria : 9MI \geq 40 kg/m ² , previous diagnosis of diabetes, blood pressure in the range of stage 2 hypertension, antipsychotic or corticosteroid medications, not am- bulatory, anorexia nervosa, bulimia nervosa, psychosis, suicidal ideation, hospitalisation, pregnancy Diagnostic criteria : as above
Interventions	 Number of study centres: 6 Treatment before study: none Description of interventions ACTION : based on the Transtheoretical Model, 3 primary components: clinical encounters with the school-based health centres clinician every 2-3 weeks for a total of 8 visits over 1 academic year. First visit dedicated to reviewing pertinent personal and family history, physical examination and laboratory findings, and assessment of dietary and physical activity behaviour; use of MI; obesity risk reduction strategies from a toolkit that was co-created with a community advisory group made of overweight and obese adolescents and their parents. The toolkit included a DVD and print materials to provide a 'menu of options' during clinical encounters with participants. DVD sections: adolescent motivation for change, strategies targeting energy balance and nutritional quality, physical aerobic dance and strength training, print materials: weight loss guidelines for clinicians, MI for clinicians, newsletter for carers, clinic displays, adolescent session tools. At the first visit, participants received the DVD, a DVD player and a summary of medical results, along with American Academy of Pediatrics (AAP) obesity prevention/treatment recommendations

Other bias	Unclear risk	Comment : unclear if they have accounted for clustering in the analysis

Kong 2014

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : aged 15-18, male or female of Chinese ethnicity, obesity $BMI \ge$ 95th percentile of local age- and gender-specific references no major medical illnesses, no chronic medications Exclusion criteria : concurrent participation in any clinical trial, dietary intervention or weight loss programme, concomitant intake of weight-reducing agent, active and uncontrolled endocrine diseases, significant renal impairment or liver impairment, gastrointestinal problems that would prevent them from following the test diets, active malignant disease, pregnant or lactating, any medical illness or condition including known noncompliance, as judged by the investigators Diagnostic criteria : as above
Interventions	Number of study centres: 1 Treatment before study: - Description of interventions Low GI diet : counselled by dietitian at weeks 0, 2, 4, 6 and 8 and at 8-week intervals, total 7 × 30-minute sessions. Parents encouraged to participate. Strategy of increasing energy expenditure and reducing caloric intake using lifestyle behavioural change. Indi- vidualised menu plan with 20% caloric restriction based on his/her current diet. Practical tips were given based on behavioural principles including goal setting, knowledge ac- quisition, problem solving, feedback and reinforcement. Consumption of low GI food, use of healthy fat and avoidance of high GI food based on the low GI pyramid empha- sised. Targeted proportion of energy from carbohydrate and fat: 45-50% and 30-35%, remainder from protein. 2 booklets were provided, 1 with food portion size exchange and tips, the other listing low GI foods and meal plans. Encouraged to perform aerobic exercise ≥ 3 days of 30 minutes per week. Ongoing support and encouragement was provided, target goals were redefined based on the participant's feelings and progress,

Nguyen 2012

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : aged 13-16 years; overweight to moderately obese (i.e. BMI z score range 1.0-2.5); home access to a landline telephone; home access to the Internet to receive e-mails or access to a mobile telephone to receive SMS messages; ability to attend the group programme for 7 weeks in the first instance on the specified days; at least 1 of the adolescent's parents/carers willing to participate in the initial 7 parent group sessions Exclusion criteria : severely obese (i.e. BMI z score > 2.5) or if there was a secondary cause for overweight/obesity; intellectual disability, significant medical illness, psychiatric disturbance; taking medications that affect weight status; inability to take part in physical activity sessions; poor level of spoken English (adolescent or parent/carer) Diagnostic criteria : BMI z score range 1.0-2.5
Interventions	 Number of study centres: unclear Treatment before study: none Description of interventions Loozit intervention : 2 phases Phase 1: adolescent and parent weekly group sessions: simultaneous group sessions. Benefits of a Loozit healthy active lifestyle (increasing physical activity; reducing sedentary behaviour, healthy eating, food labels, measuring fat and sugar in food and drinks, lunch box and snack ideas); positive self-esteem; stress management; review and maintenance; goal setting. Based on social cognitive theory. Parent sessions focussed on practical support of behavioural change in adolescents and parental role

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 90 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Nguyen 2012 (Continued)

	 modelling of healthy lifestyle changes for the family unit. Booklets used for adolescents and parents/carers during the sessions Phase 2: extended therapeutic contact (adolescents only). Main educational content of sessions was generally new (e.g. healthy take-away food options; eating out) but key messages from phase 1 were reinforced. Also sessions promoted physical activity skills development through approximately 20 minutes/session of indoor resistance activities and fun active indoor games. Group facilitators (and outcome assessors) received standardised training. A facilitators' manual was used. Facilitated by dietitians and could be run by nurses or other healthcare professionals. 14 sessions: Phase 1: 7 × 75-minute sessions; Phase 2: 5 × 60-minute sessions and 2 outcomes assessment sessions Intervention 2 : same interventions as above with additional therapeutic contact of 14 telephone coaching sessions +32 SMS/e-mail messages aimed to enhance adolescents' knowledge, skills and confidence to initiate and maintain required changes in dietary and activity behaviours. If there was a parking fee when attending to the community health centres participants were reimbursed
Outcomes	Outcomes reported in abstract of publication : BMI z score; waist-to-height ratio; total cholesterol level; triglycerides; global self-worth; dietary, physical activity or sedentary behaviour
Study details	Run-in period: none Study terminated early: no Trial identifier: ACTRN12606000175572
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "to determine the effect of additional therapeutic contact to usual treatment on body mass index (BMI) z score and waist circumference z-score in overweight and obese adolescents aged 13-16 years (at baseline) who participate in a community-based weight management program (the Loozit group program)."

Norman 2016 (Continued)

	management or diseases affecting absorption or processing of nutrients Diagnostic criteria : as above
Interventions	 Number of study centres: not clear Treatment before study: none Description of interventions Stepped-down care : based on a combination of Chronic Care Model and social cognitive theory. Chronic Care Model provided a conceptual framework for the healthcare delivery for adolescents with obesity of chronic illness management in a primary care setting. Chronic Care Model emphasises interdisciplinary team input. Within the Chronic Care Model framework, social cognitive theory constructs of behaviour self-management were applied and included: building self-efficacy, goal setting, feedback, identifying barriers and social support. The intervention followed modified recommendations from the American Academy of Pediatrics for treatment of childhood obesity and consisted of 3 × 4-month steps. The goal was for adolescents to lose at least 4 lb every 4 months. If the participant did not meet the goal, then the step was repeated. If a 4-lb weight loss was achieved, the participant was 'stepped-down' to the next level of reduced intensity. The number and frequency of treatment elements varied for each intervention step. At the start, the physician provided brief counselling on healthy behaviours. If progress was not made, then follow-up occurred and focused on weight management strategies. Face-to- face health educator visits occurred monthly in step 1 and bi-monthly in step 2 and were available to the child and parent, but the parent was not required to attend. Biweekly telephone calls were used to review progress and help adolescents set new goals and discuss barriers and solutions, and speak to parent to reinforce parental involvement and emphasise importance of healthy changes in the home environment to encourage goal attainment. Diet and physical activity education materials were distributed to adolescents and their parents at each visit. Pedometers were distributed at the initial health educator visit to monitor physical activity and help participants set appropriate physical activity goals<
Outcomes	Outcomes reported in abstract of publication: BMI, adiposity, biometric outcomes
Study details	Run-in period : 2-week run-in screening programme was conducted. Adolescent-parent dyads were asked to perform some of the activities that would be required of them if they were to be enrolled in the intervention trial. These tasks included attending a measurement visit; scheduling and completing a telephone call with a study staff member; locating a food item at home, reading the food label and describing the nutrition content; tracking basic food intake and physical activity in a written diary over 4 days; and scheduling and attending a follow-up appointment Study terminated early : no Trial identifier : -

		bers randomised
Selective reporting (reporting bias)	High risk	Quote from author: "There were other outcome measures that were not included in the paper. These included the follow- ing: Physical Activity based on self-report, Quality of Life, Calories, food and nutri- ent intake based on self-report, sedentary behavior based on self-report." Comment: reported by the author but rea- sons not explained
Other bias	High risk	Quote from publication: "The run-in programme was conducted to minimize participant attrition, but may have resulted in a more motivated sample of participants and parents compared with non-run in trial cohorts." Comment: study participants may have had higher motivation and much more likely to follow the intervention

Pakpour 2015	5
--------------	---

Methods	Parallel RCT, randomisation ratio: 1:1:1, superiority design
Participants	 Inclusion criteria: aged 13-18 years, obese (≥ 95th percentile for age and gender), adolescents lived with a parent or adult carer who was prepared to be involved in treatment Exclusion criteria: taking weight-related medication, having a diagnosis of an eating disorder, being pregnant, having clinical mental health conditions or psychosis Diagnostic criteria: BMI > 95th percentile for age and gender
Interventions	 Number of study centres: 1 Treatment before study: none Description of interventions Weekly sessions: participants in both intervention groups received 6 × 40-minute individual counselling sessions on diet and exercise MI : targeted improved eating and physical activity behaviour. All adolescents were encouraged to express their personal motivation to change their physical activity and dietary behaviour. Adolescents assisted with reducing resistance and overcoming ambivalence about behaviour change. MI techniques such as reflective listening, open-ended questions and eliciting self-motivational statements. The intervention was initiated based on the underlying spirit of the MI Session included: in the first phase, the counsellors aimed to foster a confident relationship with the adolescents, address the positive and negative effects of obesity, and increase the adolescents' awareness of their current weight status. In the second phase, alternative courses of action were taken into account, costs and benefits of actions were discussed,

Pakpour 2015 (Continued)

	and adolescents' readiness to change was evaluated. In the third phase, adolescents were invited to engage in goal setting and planning for change. Adolescents were encouraged to create an action plan Also encouraged to achieve at least 60 minutes of moderate-to-vigorous intensity physical activity daily as recommended by the World Health Organization. Encouraged to eat a variety of foods from each of the 4 major food groups and low-fat alternatives The facilitators (dietitian or exercise specialist) completed 20 hours of MI training from a certified and experienced MI trainer MI + parental Involvement : identical MI sessions to above. In addition, 1 in-person parent MI session identical in MI style as used for adolescents, focusing on the adolescents' weight, parents' attitudes and behaviours regarding children's physical activity and dietary habits, parent monitoring and supervision; the goal was to promote progress toward the child's intervention goals and attitudes by the parents. The role of parenting in preparing healthy foods for their child and encouraging/monitoring them for being physically active were discussed. Delivered at the end of the 6th session and lasted for > 60 minutes Passive control group : no details

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 97 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. Patrick 2013

Methods	Parallel RCT, randomisation ratio: 1:1:1:1, superiority design
Participants	Inclusion criteria: aged 12-16 years, at "high risk" for diabetes, as defined by the Amer- ican Diabetes Association expert consensus panel, overweight BMI > 85th percentile for age and gender, weight and height > 85th percentile, or weight > 120% of ideal for height) + any 2 of the following risk factors: family history of Type 2 diabetes mellitus in a first- or second-degree relative, race/ethnicity (American Indian, African-American, Hispanic, Asian/Pacific Islander), or signs of insulin resistance (acanthosis nigricans, hy- pertension, dyslipidaemia, polycystic ovary syndrome) Exclusion criteria: diagnosis of diabetes, pregnant, not planning to be in the San Diego area over the entire study period, had any medical condition that would prevent them from participating in the intervention Diagnostic criteria: as above
Interventions	 Number of study centres: 18 Treatment before study: none Description of interventions 4 comparator groups, 3 included a website intervention: website only, website and group and website and SMS, and 1 usual care Website only : website and tutorials designed to promote weight loss and healthy behaviours related to obesity such as educational topics and challenges based on skill building exercises, a reward system to encourage success, evaluation for assessment of progress and feedback on progress. Web tutorials on several behaviour change strategies, such as goal setting, seeking social support and positive self-statements. Theoretical based on the behavioural determinants model and the Transtheoretical Model of behaviour change 3 phases, phase 1 (weeks 1-17) entailing education on healthy behaviours, phase 2 (weeks 18-34) interactive games and quizzes for the participant to select challenges and goals, phase 3 (weeks 35-51) interactive and also encouraged working on multiple behaviours at the same time. Also had weekly "check-in" e-mails, monthly mailed tip sheets and, if necessary, a telephone call from a health counsellor Based on the "stoplight approach," participants were encouraged to limit red-light activities (unproductive, low energy), increase green-light activities (high energy) and do yellow-light activities in moderation The website also included information on recommended food portion sizes, categorisation of foods into the stoplight approach, and a resource library that included tip sheets and received monthly group sessions Website and SMS : minimum of 3 text messages per week that related to weekly challenges and intervention gals as well as the website (treatment as 'website only'). Reminder text message sent if the participants were provided with mobile phones and prepaid text message plans that allowed research staff to monitor SMS use

Patsopoulou 2017		
Methods	Parallel RCT, randomisation ratio	o: 1:1:1, superiority design
Participants	Inclusion criteria: overweight or obese students Exclusion criteria: - Diagnostic criteria: Cole criteria	
Interventions	 Number of study centres: 15 Treatment before study: - Description of interventions Activity : training was directed by a professional teacher of physical education. The training programme was designed according to the type and intensity of exercise that school children normally performed. Many activities were delivered as games to encourage enthusiasm and participation. Endurance type activities accounted for most of the time spent in training (about 50% team sports and 50% running games), with attention to co-ordination and flexibility skills Diet + activity : training programme + the same activity trainer information was presented about the reasons behind childhood obesity, dietary and cooking habits, and the motivation for weight loss to involve the whole family in the "battle" against obesity. Discussion with participants on the food pyramid, food choices, food labels, food preparation and cooking, eating habits, regular meals and controlling environments that stimulate overeating. The topics discussed were given to the adolescents in the form of a printed notebook, while parents were also invited to attend these sessions 	
Outcomes	Outcomes reported in abstract of publication : BMI, waist circumference, blood pressure, Family Eating and Activity Habits Questionnaire	
Study details	Run-in period: - Study terminated early: no Trial identifier: NCT02653508	
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal	
Stated aim for study	Quote from publication: "test the efficacy of two intervention groups, physical activity in isolation and combination of physical activity with provision of dietary information, in improving overweight and obesity in adolescents and also to compare each of them to a control group."

Pbert 2013

Methods	Cluster RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : participants in grade 9-11, BMI \geq 85th percentile for age and gender. Provided assent and had parental consent. Had at least 1 English-speaking parent Exclusion criteria : planning to move out of the area, had a medical condition that precluded adherence to the intervention, diagnosis of a serious psychiatric illness, genetic or endocrine cause of obesity, taking a medication associated with weight gain or weighing \geq 300 lbs Diagnostic criteria : as above
Interventions	Number of study centres: 8 Treatment before study: none Description of interventions "Lookin' Good Feelin' Good" intervention : incorporated recommendations for the prevention and treatment of child and adolescent overweight and obesity and based on social cognitive theory. 6×1 -to-1 counselling sessions of 18-29 minutes over 2 months, during the school day in non-academic classes in the school nurse's office. Used the 5-3- 2-1-0 approach to support making 5 daily key behaviour changes: \geq 5 servings of fruit and vegetables; 3 structured meals; \leq 2 hours of television, computer, electronic games; \geq 1 hour moderate physical activity, 0 limit soda and sugar-sweetened drinks A participant-centred counselling approach allowed school nurses to tailor the interven- tion to the student's needs. At each visit there was a weigh-in and feedback, review of diet and physical activity logs, assessing progress to behaviour change goals, reviewing successes, problem solving, setting new goals, assessing behaviour and identifying barri- ers Provided and instructed in the use of a pedometer. A USD25 gift certificate was provided at each assessment. School nurses were trained through a daylong group training session Control : 6×1 -to-1 visits with the school nurse for 8.5-9 minutes over 2 months to review behaviour changes, read 6 informational pamphlets on weight management and had questions answered

Pitetti 2007 (Continued)

	to follow instructions to perform treadmill walking Exclusion criteria: had no medical contraindications (i.e. cardiovascular/respiratory anomalies) or significant primary sensory or motor impairments that restricted them from treadmill walking Diagnostic criteria: not stated
Interventions	Number of study centres: 1 Treatment before study: none Description of interventions Treadmill walking group : weekly activity, regular activity classes (i.e. 15-30 minutes, Monday-Wednesday-Friday) consisted of treadmill walking, when regular activity classes were not planned (i.e. Tuesday and Thursday), taken to the gym and given the oppor- tunity to walk on the treadmill, given the opportunity to walk on the treadmill at their residence in the evenings All 10 participants trained to walk unassisted on the treadmill during their regular class time Initial frequency of twice per week, progression of 1 day every 2 weeks to a peak frequency of 5 times per week. Duration was for 8 minutes per session, with a progression of 1-2 minutes every 2-3 weeks to a peak duration of 20 minutes per session. Initial treadmill speed 2.4-3.5 mph, with a progression of 0.1-0.3 mph every 2-3 weeks to a peak speed of 3.7-4.1 mph. Initial grade of 0%, with progressive increases of 0.5% The activities took place under the guidance of a staff member with a Master's degree in adapted physical activity Control group : leisure activity of choice 3 times per week. Not a strict schedule. Student Support Plan designed and implemented by the residential treatment facility staff members, allowed for 30 minutes of 'leisure activity', 3 times per week, at the campus gym. These activities took place under the guidance of a staff member with a Master's degree in adapted physical activity. Classes permitted participants to engage in the following activities; basketball (shooting, dribbling, passing), jumping rope, roller skating, scooter-board activities, object control skills (i.e. throwing and catching the ball) , striking a ball (i.e. tennis or nerf) with a tennis racket or plastic bat and cycling skills (e.g. adult bicycle or tricycle)
Outcomes	Outcomes reported in abstract of publication: BMI, treadmill walking
Study details	Run-in period: prior to initiating the study, all 10 participants had been trained to walk unassisted (i.e. not holding on to railing) on the treadmill during their regular class time (e.g. 1-3 times per week, duration of 5-10 minutes) and, therefore, were acclimated to the use of the treadmill Study terminated early: no Trial identifier: -
Publication details	Language of publication: English Funding not stated Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "The purpose of this study was to determine the efficacy of in- corporating a 9-month treadmill walking program into the weekly academic curriculum of youth with severe developmental disabilities including autism."

Notes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Comment : randomisation was unclear from the manuscript. After contact with the authors to check on method of ran- domisation information was provided: "it was a randomized allocation using ran- dom assignment or random placement. We flipped a coin and "heads" assigned the par- ticipant to the treadmill group and "tails" assigned the participants to the control group." Comment : appropriate
Allocation concealment (selection bias)	Unclear risk	Comment : randomisation by coin toss
Blinding of participants and personnel (performance bias) Objective outcomes	Unclear risk	Comment : authors stated, "Participants were severely developmentally disabled, so they had limited to no ability to be cog- nizant of whether they were in the supple- mental treadmill walking or control group. "
Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Comment : no details blinding outcomes assessors. No member of the research team or outcome assessors participated during or was present in the exercise portion, respec- tively. Objective outcomes unlikely to be affected by lack of blinding
Incomplete outcome data (attrition bias) Objective outcomes	Low risk	Comment : no attrition
Selective reporting (reporting bias)	High risk	Comment: exercise capacity (treadmill walking frequency, speed, elevation) not reported. Authors stated that all measured outcomes were reported
Other bias	Low risk	Comment: no other bias

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 106 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. Resnicow 2005

Resnicow 2005	
Methods	Cluster RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria: African-American girls aged 12-16 years and BMI > 90th percentile for age and gender, churches where the majority of members' household income was above USD40,000 Exclusion criteria: unclear Diagnostic criteria: used the 90th percentile as inclusion cut-off point rather than the 85th percentile based on formative research and pilot studies. Girls on the lower end of the obesity continuum, i.e. 85th to 90th percentile, were different behaviourally and psychologically, and combining girls from the low and high ends of the obesity continuum would adversely affect group cohesion
Interventions	Number of study centres: 10 Treatment before study: none Description of interventions High intensity (24-26 sessions) : girls attended weekly group behavioural sessions. Parents were encouraged to attend sessions (around 12 sessions). Each group session included an experiential, interactive behavioural activity, at least 30 minutes of mod- erate-to-vigorous physical exercise, and preparation or consumption (or both) of low- fat, portion-controlled meals or snacks. Target behaviours included: increased fruit and vegetable intake, decreased fat intake, decreased fast-food intake, decreased sedentary behaviour and increased physical activity. Girls were taught to reshape their target be- haviours using the principles of substitution, moderation and abstinence. Girls focused their behaviour change on target foods or priority behaviours identified or selected by the girls. At the beginning of each intervention cycle, girls only attended a 1-day retreat where participants completed a low ropes course and team building activities, ate healthy portion-controlled meals and attended a group session on hunger and satiety. All girls received a 2-way paging device. Messages, developed by the girls based on their target foods and activity patterns, were sent to them throughout the day and in key times when they needed reminders about their eating or physical activity. Received 4-6 MI calls by telephone over the 6 months of intervention to support and help in behavioural change Moderate intensity (6 sessions) control : sessions were selected from the larger pool of sessions delivered to the high-intensity group. Parents were encouraged to attend sessions (3 sessions). Topics included fat facts, barriers to physical activity, fad diets, neophobia (i.e. fear of new foods) and benefits of physical activity. Girls did not receive the 2-way pagers, MI telephone calls or kick-off retreat
Outcomes	Outcomes reported in abstract of publication: BMI units and % body fat
Study details	Run-in period : churches were contacted either by telephone or in-person and adminis- tered a brief screening instrument that queried their membership numbers and socioe- conomic status Study terminated early : no Trial identifier : -
Publication details	Language of publication : English Other funding : "given that the sponsoring agency was unable to provide any additional funding, we were able to complete the study in only 10 of the projected 12 churches." Publication status : peer-reviewed journal

Resnicow 2005 (Continued)

Stated aim for study	Quote from publication: "The primary aim of the project, called Go Girls, was to develop and test a culturally tailored intervention program for overweight 12- to 16-year-old AA [African-American] adolescents and their parents."

Notes

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote from publication: "Before ran- domization, a pool of middle and upper income churches was identified by project staff based on prior projects as well as telephone directory and internet searches, Churches were then contacted either by telephone or in person. Only churches that reported that the majority of mem- bers' household income was above \$40, 000 [USD40,000] were included." "A to- tal of 10 churches (including the aggregate church) were randomized to condition, five treatment (high intensity) and five compar- ison (moderate intensity)." Comment: there was no difference in base- line parameters between groups
Allocation concealment (selection bias)	Unclear risk	Quote from publication: "A total of 10 churches (including the aggregate church) were randomized to condition, five treatment (high intensity) and five comparison (moderate intensity)." Comment: no further details
Blinding of participants and personnel (performance bias) Objective outcomes	Unclear risk	Comment: no mention of blinding
Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Comment : no mention of blinding, objective outcomes unlikely to be affected by lack of blinding
Incomplete outcome data (attrition bias) Objective outcomes	Low risk	Quote from publication: "no evidence of differential attrition, because girls in the moderate-intensity group who dropped out did not significantly differ from drop- outs in the high-intensity group." "In in- tention-to-treat analysis, there was no sig-

Resnicow 2005 (Continued)

		nificant group difference for BMI, the trial's main outcome, nor were there significant group effects for any of the secondary out- come." Comment : reported numbers lost to fol- low-up but reasons not provided
Selective reporting (reporting bias)	Unclear risk	Comment : protocol unavailable
Other bias	Low risk	Comment : before randomisation, a pool of middle- and upper-income churches was identified by project staff based on prior projects as well as telephone directory and Internet searches. Churches were then con- tacted either by telephone or in-person and administered a brief screening instrument that queried their membership numbers and socioeconomic status. Only churches that reported that the majority of members household income was above USD40,000 were included. Churches requested that the comparison condition receive a meaning- ful intervention. It was agreed on by the church representatives and study staff that 6 sessions represented a meaningful inter- vention of sufficient benefit that would not jeopardise between-group differences. However, using different timings in the comparator (once per month instead of once per week) and this may have had an impact For cluster analysis - quote: "Outcomes were analyzed with a mixed model repeated measures ANOVA program, SAS PROC MIXED (SAS Institute, Cary, NC), that allows for adjustment of subject non-inde- pendence within churches."

Saelens 2002

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : aged 12-16 years, 20-100% above the median (50th percentile) for BMI for age and gender. Interested in weight control, not currently engaged in another weight control programme, and otherwise healthy as determined by a paediatrician Exclusion criteria : - Diagnostic criteria : as above.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 109 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Interventions	Number of study centres: unclear	
	Treatment before study: none	
	Description of interventions	
	Healthy Habits : computer and telephone intervention. Adolescents engaged in a computer program after baseline assessment, the program was adapted from PACE+ software designed for adolescents and modified for overweight adolescents. It assessed eating, physical activity and sedentary behaviour and guided adolescents through individualised plans generated to increase physical activity or decrease sedentary behaviour and decrease dietary fat or increase fruits/vegetables or decrease overeating/snacking. Plan generation included identifying benefits, barriers and specific strategies to achieve goals. Action plan summaries were generated, and a provider summary was produced for the behaviours targeted by the adolescent. Met with a paediatrician to discuss action plans (tailored physician counselling), and approximately 1 week after the clinic visit met the study author to discuss upcoming mail and telephone contacts and to learn food selfmonitoring. Calls from a telephone counsellor 1 week later detailed telephone scripts to address adolescents' weight change since the last call, the link between weight change and eating and physical activity behaviours, instruction and feedback on self-monitoring, goals and behavioural skills Provided with a manual and information sheets. Self-monitoring of food and beverage intake and calories consumed Foods were categorised into green, red or no colour foods. Green defined as ≤ 1 g of fat per serving, 150 calories per serving and providing a good source of ≥ 1 valuable dietary components (e.g. calcium, fibre or protein), red foods were defined as having ≥ 5 g of fat per serving or were diet versions of high-fat foods. The eventual green food goal was 40 green food servings (based on standard serving sizes) or more per week, and the red food goal was 15 red food servings per week	
	minutes of at least moderate-intensity physical activity on 5 days per week with gradual increases from baseline Overall duration 16 weeks with 13 sessions. Paediatricians trained with the study protocol and telephone counsellors (with at least a Bachelor's degree in psychology or nutrition) received weekly supervision Standard care control : non-tailored physician-counselling session. 1 session in the 16-week treatment period by the same paediatrician as the intervention group. Assessed/ encouraged the adolescent's motivation for weight-related behaviour change, provided information about short- and long-term health consequences of high weight status and benefits of better weight control, made recommendations for healthful eating consistent with the Food Guide Pyramid, reviewed physical activity recommendations for adolescents (60 minutes per day of at least moderate-intensity physical activity), and encouraged consistency and persistence with health behaviour changes. Used a worksheet to facilitate the discussions. Adolescents encouraged to implement recommended behaviour changes on their own and with the help of their family Adolescents received USD25 for post-treatment and USD25 for follow-up assessment. In the intervention group, a lottery occurred after all adolescents had completed post-treatment assessment for USD50. Adolescents were awarded 1 point each for meeting self-monitoring, physical activity, calorie, green food goals and red food goals each week

Saelens 2002 (Continued)

	based on the counsellor's review of self-monitoring booklets. Points were accumulated for tickets for a study-based lottery (1 point = 1 ticket)
Outcomes	Outcomes reported in abstract of publication : BMI z scores, behavioural skills use, energy intake, % calories from fat, physical activity, sedentary behaviour and problematic weight-related or eating behaviours/beliefs, feasibility and participant satisfaction
Study details	Run-in period: - Study terminated early: no Trial identifier: -
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "This study evaluates the post-treatment and short-term follow- up efficacy of, as well as participant satisfaction for, a 4-month behavioral weight control program for overweight adolescents initiated in a primary care setting and extended through telephone and mail contact."
Notes	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Quote from publication: "Randomiza- tion occurred by selection among opaque envelopes labelled with levels of percent overweight, each envelope containing an HH [Healthy Habits] or TC [typical care] card." Comment: unclear how envelopes were se- lected or how the labelling affected selec- tion
Allocation concealment (selection bias)	Unclear risk	Quote from publication: "Randomiza- tion occurred by selection among opaque envelopes labelled with levels of percent overweight, each envelope containing an HH or TC card." Comment: unclear if assignment envelopes were used with appropriate safeguards (e. g. if envelopes were sealed or sequentially numbered)
Blinding of participants and personnel (performance bias) Subjective outcomes	Unclear risk	Comment : no blinding of carers, unclear if participants blinded

Selective reporting (reporting bias)	Unclear risk	Comment : not enough information to judge
Other bias	Low risk	Comment : no other bias

Savoye 2007

Methods	Parallel RCT, randomisation ratio: 2:1, superiority design
Participants	Inclusion criteria: BMI > 95th percentile based on the CDC growth chart, aged 8-16 years, English-speaking ability, shown an interest in the weight management programme, have a carer (e.g. father, mother or grandparent) who was willing to participate in the educational component of the programme Exclusion criteria: had diabetes, psychiatric disorder (e.g. schizophrenia, severe autism or mental retardation, or psychosis) or other serious medical condition that would preclude participation in the programme, taking medications that potentially cause significant weight gain (e.g. risperidone, olanzapine, clozapine) as well as using medications for weight loss or involved in a coexisting weight management programme Diagnostic criteria: as above
Interventions	Number of study centres: 1 Treatment before study: none Description of interventions Bright Bodies weight management : nutrition/behaviour modification once (40 min- utes each) per week: behaviour modification classes for participants and carers were held separately. Topics were provided from the Smart Moves Workbook, a curriculum devel- oped for overweight children and used in the authors' pilot study. Sample topics included Ready, Set, Goal!, Risky Business: Identifying High-risk Situations, Environmental En- gineering, Mirror, Mirror on the Wall, Bullies, Teasers, and Other Annoying People and

Savoye 2007 (Continued)

	Oops I Slipped - Understanding a Relapse. Attended the programme twice per week for 6 months and then every other week for an additional 6 months Techniques included self-awareness, goal setting, stimulus control, CST, cognitive behaviour strategies and contingency management. Behaviour modification classes for carers included topics that reflected the challenges that parents verbalised. Classes emphasised the importance of the parents' roles in modelling healthy behaviour change. Motivational tools were used to encourage regular attendance Each class of high-intensity exercise to sustain 65-80% of the age-adjusted maximal heart rate held twice (50 minutes each) and nutrition/behaviour modification once (40 minutes each) per week. Participants were also encouraged to exercise 3 additional days at home per week and to decrease sedentary behaviours. The minimum activity that each participant completed was 100 minutes per week (2 × 50-minute sessions) for the first 6 months and 100 minutes twice per month for the last 6 months The nutrition education component of the weight management programme used a nondiet approach that emphasised low-fat, nutrient-dense foods of moderate portion sizes No details of trainer provided, registered dictitians supervised nutritional component Control : received diet and exercise counselling by registered dictitans and physicians along with brief psychosocial counselling by a social worker. The participant and carer were both involved in setting the nutrition and activity goals to ensure that he clinic plan was realistic and accepted by both. Exercise counselling included decreasing sedentary activities (computer and video games) and finding an activity the participant enjoyed enough to engage in on a regular basis. Nutrition counselling included decreasing intake of juice, switching to diet beverages, switching from whole-fat to low-fat milk and bringing lunch to school vs choosing hot lunch. 30-minute session every 6 months	
Outcomes	Outcomes reported in abstract of publication : BMI z score, BMI, % body fat, total body fat mass, total cholesterol, HDL and LDL cholesterol, insulin resistance	
Study details	Run-in period: none Study terminated early: no Trial identifier: NCT00409422	
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal	
Stated aim for study	Quote from publication: "to compare changes in BMI, body composition, insulin sen- sitivity, blood pressure, and lipid profiles, a secondary aim was to compare nutrition components by randomizing families in the weight management group to either the better food choices or structured meal plan approaches."	
Notes	The study initially re-randomised those in the weight management group to either a meal plan group or a better food choices group. After high levels of attrition in the meal plan group (at 6 months, 83%) this arm was discontinued. No results for this group were reported	
Risk of bias

Savoye 2007 (Continued)

Random sequence generation (selection bias)	Low risk	Quote from publication: "Participants were randomly assigned 2:1 by using a per- muted block design to the weight manage- ment or clinic control group by the same co-investigators who recruited the partic- ipants. Random assignments were gener- ated by computer and concealed by the study statistician (Dr Dziura)." Comment: appropriate
Allocation concealment (selection bias)	Unclear risk	Comment : stated allocation was main- tained by the study statistician and was con- cealed but no details reported
Blinding of participants and personnel (performance bias) Objective outcomes	High risk	Quote from publication: "Participants were not blinded to treatment group. They knew if they were returning back to clinic only (control) or Program (experimental) at the school. Personnel were not blinded during treatment phase either because they knew if subject was going to the Program." Comment: high risk of performance bias
Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Comment : no details on blinding; how- ever, low risk of bias from objective out- comes
Incomplete outcome data (attrition bias) Objective outcomes	Low risk	Comment : numbers and reasons provided, used ITT analysis
Selective reporting (reporting bias)	Unclear risk	Quote from publication: "We have reported all the outcomes measured except for psychosocial outcomes which we are writing a manuscript for as we speak. We assessed self-concept of children and family dynamics of family using Piers-Harris Self Concept Scale and Family Assessment Device, respectively. We plan to submit this manuscript by January 1." Comment: the results at 6 and 12 months were different in each publication
Other bias	Low risk	Comment : no other bias

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 114 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. Schranz 2014

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : males aged 13-17 years; considered to be very overweight or obese (very overweight defined as being above the mid-point between the age- and gender-specific BMI cut-offs for overweight and obesity were 23 kg/m ² and 25 kg/m ² , respectively, then the BMI cut-off for very overweight was calculated to be 24.0 kg/m ² ; Cole criteria); Tanner stage \geq 2; categorised as a low or moderate risk by the Sports Medicine Australia screening questionnaire or, if categorised as high risk, obtained a medical clearance from their general practitioner and had no history of injuries or musculoskeletal conditions Exclusion criteria : < Tanner stage 2; categorised as a high risk by the Sports Medicine Australia pre-exercise screening questionnaire and did not obtain a medical clearance training; exhibit musculoskeletal conditions which would place them 'at risk' as a result resistance training Diagnostic criteria : as above
Interventions	Number of study centres: 1 or 2 gymnasia Treatment before study: - Description of interventions 6-month resistance training programme : 3 × 75-minute sessions per week on non- consecutive days. Each session included a 10-minute warm-up, 60 minutes of resistance training, and a 5-minute static stretching cool down. A total of 10 separate multijoint exercises and single-joint exercises for major muscle groups were trained during each session. Weight-stacked machines and free-weight exercises were used Control : no intervention: instructed to continue with normal everyday activities. After completion of the 12-month assessment, offered a complimentary 3-month gym mem- bership
Outcomes	Outcomes reported in abstract of publication : exercise self-efficacy, resistance training confidence, self-esteem, body composition
Study details	Run-in period: orientation to the resistance training equipment run by 1 of the trainers to familiarise with machines, estimate 1-repetition maxima to guide strength testing, to determine a starting load Study terminated early: no Trial identifier: ACTRN12609001078246
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "to determine the effect of a 6-month resistance training in- tervention on the self-concept strength and body composition of overweight and obese adolescent males."

Sigal 2014

Methods	Parallel RCT, randomisation ratio: 1:1:1:1, superiority design
Participants	Inclusion criteria : BMI \geq 95th percentile for age and gender or \geq 85th percentile for age/gender with an additional diabetes risk factor (criteria stated), or both; waist circumference \geq 75th percentile for age and gender; aged 14-18 years; post-pubertal (Tanner stage IV or V); sedentary for \geq 4 months prior to enrolment. Had to attend \geq 13 out of 16 prescribed sessions (> 80% adherence) during run-in Exclusion criteria : participation in previous 4 months in a regular programme of exer- cise or aerobic sports \geq 2 times per week for at least 20 minutes per session; diabetes; body weight > 159 kg or BMI > 45 kg/m ² , or both; use of any performance-enhanc- ing medication; use of medication/herbal supplement likely to affect body composition, lipids or glucose metabolism (metformin permitted); significant weight change; uncon- trolled hypertension; activity restrictions due to disease; other illness; unwillingness/lack of availability to attend exercise and/or nutrition sessions; significant cognitive deficit; pregnancy or intention; inability to communicate in English or French

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 117 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

	Diagnostic criteria: as above
Interventions	Number of study centres: 1 Treatment before study: - Description of interventions All groups had 3 counselling sessions (baseline, 3 months and 6 months) by a registered dietitian to promote healthy eating, with a daily energy deficit of 250 kcal (see details of run-in session). Also had telephone support at 6 weeks and 4 months The 3 exercising groups attended gyms 4 times weekly. Duration 22 weeks. Exercise was supervised by personal trainers weekly to 3 months, and biweekly from 3-6 months. Personal trainers monitored attendance and exercise progression by reviewing sign-in sheets and exercise logs. To encourage adherence and retention, participants completing all measurement assessments received a USD50 gift certificate. In addition, participants who maintained good compliance (≥ 70% of sessions attended) obtained a free gym membership renewal for a subsequent 6-month period (postintervention) Diet + aerobic exercise : followed diet plan + exercised on treadmills, elliptical machines or bicycle ergometers. Heart rate monitors used to adjust workloads to achieve target heart rates. Gradual progressed in exercise duration (20-45 minutes per aerobic exercise session) and intensity (65-85% of maximum heart rate) Diet + resistance exercise : followed diet plan + performed 7 exercises using weight machines or free weights, progressing from 2 sets of 15 repetitions at moderate intensity to 3 sets of 8 repetitions at the maximum resistance that could be moved 8 times (8- RM), duration progressed to a maximum of 45 minutes Diet + aerobic + resistance exercise : followed diet plan + full aerobic training pro- gramme + resistance training programme during each session Diet-only control : followed the same eating plan as those in the exercise groups, wait list control as offered the option to begin an exercise programme (with a free gym membership) for the subsequent 6 months
Outcomes	Outcomes reported in abstract of publication: % body fat, waist circumference
Study details	Run-in period : 4-week run-in period to assess compliance with low-intensity aerobic and resistance exercise for 4 sessions per week. Individually supervised by a personal trainer 2 sessions per week. Also small group sessions (n = 12) covering various topics: barriers in achieving healthful eating, solutions to overcome them, taste panels. The recommended macronutrient energy distribution was 15-20% protein, 50-55% carbohydrates and 30% fat. To qualify for randomisation, participants had to attend at least 13 out of 16 prescribed sessions (> 80% adherence) during run-in Study terminated early : no Trial identifier : NCT00195858
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "to determine the effects of aerobic training, resistance train- ing, or their combination on percentage body fat and cardiometabolic risk markers in previously inactive postpubertal overweight and obese adolescents."

Toulabi 2012		
Methods	Parallel RCT, randomisation ratio: 1:1, sup	periority design
Participants	Inclusion criteria : absence of morbid obesity (hormonal disorders such as hypothyroidism, Cushing's syndrome, etc.), absence of weight-reducing diets or drugs affecting body weight, participation of 1 parent (with a minimum educational level of 9th grade) in the study, tendency of the students and parents to lose weight, BMI > 28 kg/m ² in the 1st grade students (15 years old), and BMI \geq 29 kg/m ² in the 2nd grade and 3rd grade students (16 and 17 years old) Exclusion criteria : consuming special diets, taking drugs affecting body weight, or not complying with the intended conditions or criteria (due to the holidays or examination periods) Diagnostic criteria : as above	
Interventions	 Diagnostic criteria: as above Number of study centres: 12 schools Treatment before study: none Description of interventions Behaviour modification programme : implemented by a nursing expert and a physical education expert for the participants (based on the compiled training booklets). 24-hour diet record for participants and parents; face-to-face nutritional instructions for the parents supported by an educational booklet (during 4 × 1-hour weekly sessions); face-to-face nutritional instructions for the parents supported by an educational booklet (during 4 × 1-hour weekly sessions); face-to-face nutritional instructions for the participants on dietary modification and techniques for increasing physical activity, supported by an educational booklet (during 8 × 45-minute sessions, held twice per week); exercises demonstrated by the physical education expert at school in a group, 1 hour per day, 3 days per week, for 6 weeks The exercise programme consisted of warming up for 10 minutes, performing aerobic exercises for 40-45 minutes and cooling down for 5-10 minutes, and included rapid and vigorous walking, running, rope jumping, zigzag movements, high-knees, butterfly movements, stepping exercises and exercises for strengthening important muscles (e.g. rectus abdominal, quadriceps, trapezius and latissimus dorsi) Control : provided with educational booklets after data collection 	
Outcomes	Outcomes reported in abstract of publication : weight, BMI, and waist and hip cir- cumferences; students' and parents' nutrition knowledge; symptoms of depression	
Study details	Run-in period: none Study terminated early: no Trial identifier: trial was registered at Metabolism Research Center, Tehran University of Medical Sciences, Tehran under the number 578

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 121 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. van Egmond-Frohlich 2006

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design	
Participants	Inclusion criteria : participating in an inpatient rehabilitation programme with obesity as the primary indication (BMI > 97th percentile), aged 9-16 years, informed consent Exclusion criteria : secondary obesity, language barriers, duration of rehabilitation < 28 days, type 1 diabetes, psychiatric disease Diagnostic criteria : BMI > 97th percentile.	
Interventions	Number of study centres: 320 physicians Treatment before study: rehabilitation programme Description of interventions Behavioural education programme : after the rehabilitation programme, participating physicians of the intervention group received a practice guideline. Telephone consul- tation was offered. Key items of the guideline were: addressing the guilt or fate prob- lem; treatment aims (health promotion activities); guidance on fat-limiting mixed diet; promotion of a physical active lifestyle; local support resources; promotion of flexible control of eating; patient guidance according to the public health counselling and self- management model; the outpatient programme was intended to have health check-ups every 4 weeks during the first 12 months (10-12 appointments); the intervention was financed by the health insurer AOK Sachsen-Anhalt in the context of research funding Standard of care control : -

Vissers 2008 (Continued)

	were instructed to work out at least 3 times per week. These workout sessions consisted of a mix of aerobic and strength exercises. In general, a session this would typically include: short warming up and stretching; 30 minutes of aerobic exercises such as treadmill running, cycling, rowing, stepping; strength exercises focused on large muscle groups such as pectoral, upper arm, abdominal and leg muscles; and a cooling down period. The practical implementation of these general guidelines was left to the respective fitness centres Participants in the intervention group were offered nutritional counselling by a dietitian. Topic of these counselling sessions was healthy food choices and maintaining a proper energy balance. Every session there was a specific theme, e.g. breakfast, snacks, drinks, dairy products, fast food, portion sizes, nutritional labelling, motivation and coping strategies, based on the Flemish model of 'the active food pyramid', as proposed by the Flemish institute of Health Promotion, an inventory of specific food product and popular brands in adolescents, categorised by health effect, was developed as an attractive hang- up model. Main goals were improving food knowledge, attitude and behaviour Total sessions: 6 nutrition sessions: individual or group (maximum of 2 group sessions) once per month. Took place in school after or between school hours. 6 counselling sessions once per month. No mention of total length of session but they included 30- minute aerobic exercises Training for instructors not stated Control : continued to participate in standard gym classes
Outcomes	Outcomes reported in abstract of publication: weight, BMI, waist circumference, fasting glucose
Study details	Run-in period: none Study terminated early: no Trial identifier: -
Publication details	Language of publication: English Non-commercial funding Publication status: peer-reviewed journal
Stated aim for study	Quote from publication: "To study the effect of a multidisciplinary school-based lifestyle intervention for overweight and obese students attending vocational secondary school (VSE). VSE provides practice-oriented education in which young people learn a specific occupation."

Visuthranukul 2015

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	 Inclusion criteria: aged 9-16 years; BMI > International Obesity Task Force cut-off corresponding to BMI of 30 kg/m² in adulthood. Exclusion criteria: behavioural and intellectual problems that might be an obstacle to follow the diet instruction, underlying diseases that might affect a weight management programme used drugs associated with weight increment or reduction attended other weight management programmes Diagnostic criteria: as above.
Interventions	 Number of study centres: 1 Treatment before study: - Description of interventions Low-GI diet : individual goals for weight management were set. Emphasis on low-GI foods was provided. A dietitian emphasised the selection of low-GI carbohydrates that fit Thai culture and their routine lives. The energy distribution was carbohydrate 50-55%, protein 15-20% and fat 30-35%. Each visit consisted of a 2-hour, small class teaching session with parental participation (4-5 families/class). The contents varied from the 1st to 6th visit, starting from portion size and food exchange, modest energy restriction, principle of GI, sources of low-GI diet, cooking demonstration of low-GI dishes, guidance about food labelling and some games about GI of common food and beverages Control group : received conventional instructions at the nutrition clinic about low energy (approximately 1200-1300 kcal/day), low-fat (25% of total energy from fat) and high-fibre diet by another dietitian who gave the dietary advices with special emphasis on the energy restriction such as energy count and how to avoid high-fat Thai dishes as

	other cognitive behavioural treatment programme with the focus on reducing obesity Diagnostic criteria : not stated.
Interventions	 Number of study centres: 1. Treatment before study: none. Description of interventions Family-based intervention : an individual consultation with the child psychologist, group intervention with 8-10 participants in each group. Received a treatment manual with the objectives and goals of the treatment and, per session, information about the topics discussed. The focus was on the effort to change habits more than weight reduction goals. Adolescents were made aware of their own actions and their way of living that has led to their obesity Several cognitive behavioural techniques were learned (knowledge, skills and attitude) during the intensive phase of the treatment during 6 bi-weekly sessions of 2.5 hours per session. Each session contained: determination of body weight, homework discussion and evaluation, education, physical activity, role playing, discussing homework for next meeting and set goals linked to educational topics of the session. The educational topics included group bond to encourage peer support, individual motivation for participating, nutritional information and the balance between energy intake and energy expenditure, healthy nutrition, self-control techniques, coping with teasing and being teased, self-image, cognitive strategies and relapse techniques Current physical activity level and sedentary behaviour of the child also reviewed, energy intake versus energy expenditure was evaluated and visualised for the adolescent by a computer program. Options to change or optimise physical and sedentary activities were debated and the participants were advised how to find suitable exercise programmes Taught how to read product labels and obtain information on misleading advertisement and discuss how to deal with meals (breakfast, lunch, diner, 2 healthy snacks), and how to make healthy choices and develop healthy autrition, product information, quantites, eating moments, eating locations, how to help their children and parenting styles F
Outcomes	Outcomes reported in abstract of publication: BMI-SDS, HRQoL, waist circum- ference SDS, physical fitness, insulin resistance, lipid profile, high-sensitive C-reactive protein or for adiponectin
Study details	Run-in period: none. Study terminated early: no. Trial identifier: ISRCTN36146436.

Blinding of outcome assessment (detection bias) Objective outcomes	Low risk	Quote from publication: "An experienced assistant blinded for the study design mea- sures weight and height." Comment: appropriate
Incomplete outcome data (attrition bias) Subjective outcomes	Low risk	Comment : numbers and reasons provided, ITT analysis used
Incomplete outcome data (attrition bias) Objective outcomes	Low risk	Comment : numbers and reasons provided, ITT analysis used
Selective reporting (reporting bias)	High risk	Comment: some collected data not reported e.g. free fatty acid, gut hormones (all time points) lipids and inflammatory markers (postintervention)
Other bias	Low risk	Comment : no other bias

Walpole 2013

Methods	Parallel RCT, randomisation ratio: 1:1, superiority design
Participants	Inclusion criteria : overweight and obese, $BMI \ge 85$ th percentile for age and gender (WHO 2002), 10-18 years, attending a local paediatric outpatient clinic Exclusion criteria : current use of medication with possible adverse effects of weight gain/loss, non-English speaking, developmental delay, pregnant or diagnosed with an active eating disorder, or both Diagnostic criteria : as above
Interventions	Number of study centres: 1 Treatment before study: - Description of interventions Motivational interviewing intervention : counselling sessions were approximately 30 minutes long, 6 sessions held at the time of regularly scheduled healthy lifestyles ap- pointments. Interventionist was a clinical psychology doctoral student trained in MI. Guided toward increasing awareness of unhealthy behaviours, consideration of whether current behaviour was consistent with personal values and envision how change may be helpful. Where ambivalence or resistance to change, agenda setting, decisional balances and scale questions with empathy and supporting autonomy were used The interviewer was trained in MI and received professional supervision Social skills training: counselling sessions were approximately 30 minutes long, 6 ses- sions held at the time of regularly scheduled healthy lifestyles appointments. Offered advice rather than attempting to elicit ideas, prescribed goals to work on without specific regard for the client's readiness to change. Used a standardised treatment manual, de- veloped and validated for children and adolescents. Sessions were based around finding appropriate ways to navigate typical social situations Different interventionist to the MI group who was provided with feedback at monthly intervals

Characteristics of studies awaiting assessment [ordered by study ID]

Angerer 2015

Methods	Type of study: controlled clinical trial Allocation: - Intervention model: - Masking: - Primary purpose: -
Participants	Condition: Enrollment: Inclusion criteria: Exclusion criteria:
Interventions	Interventions: nutrition counselling, sport and life-skill training Comparator: -
Outcomes	Primary outcome: - Secondary outcome: - Other outcome: medical and psychological outcomes
Study identifier	-
Official title	Fit4You - a programme for prevention and reduction of overweight in apprentices in the workplace setting
Stated purpose of study	"Examined the effect of a multimodal programme including nutrition counselling, sport, and life-skill training on medical and psychological outcomes."
Notes	Unclear if it is an RCT

Barbeau 2003

Methods	Type of study: - Allocation: randomised Intervention model: Masking: - Primary purpose: -
Participants	Condition: obesity Enrollment: 55 Inclusion criteria: triceps skinfold > 85th percentile for gender, race and age; not involved in any other weight control or exercise programme; could not have limitations to physical activity Exclusion criteria: -
Interventions	Intervention : high-intensity physical training and lifestyle education Interventions : moderate-intensity physical training and lifestyle education Comparators : lifestyle education

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 138 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Barbeau 2003 (Continued)

Outcomes	Primary outcome: fasting leptin Secondary outcome: Other outcomes: body composition, visceral adipose tissue, subcutaneous abdominal adipose tissue, car- diovascular fitness, heart rate, daily physical activity, time spent sleeping, dietary intake
Study identifier	-
Official title	Influence of physical training on plasma leptin in obese youths
Stated purpose of study	Effect of 2 intensities of physical training on leptin in obese teenagers
Notes	Anthropometric outcomes not reported

Bohlin 2012

Methods	Type of study: non-inferiority study Allocation: randomised Intervention model: - Masking: open Primary purpose: treatment
Participants	Condition: obesity Enrollment: 35 Inclusion criteria: children aged 5-16 years Exclusion criteria: -
Interventions	Intervention : multidisciplinary treatment provided by the obesity treatment clinic followed by frequent telephone consultations with parents Comparator : the usual multidisciplinary treatment visits delivered provided by the obesity treatment clinic
Outcomes	Primary outcome: BMI-SDS Secondary outcome: - Other outcome: -
Study identifier	-
Official title	Can telephone consultations substitute visits in treatment of childhood obesity? Results from a randomized trial
Stated purpose of study	"To explore the possibility to substitute nurse-visits at the clinic with more frequent telephone-consultations without degrading treatment outcome measured in BMI-SDS."
Notes	Unclear if the mean age of participants was 12-16 years old. Contacted author (19 October 2015) requesting mean age and risk of bias

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 139 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Campos 2017

Methods	Type of study: - Allocation: - Intervention model: - Masking: - Primary purpose: -
Participants	Condition: - Enrollment: 148 Inclusion criteria: - Exclusion criteria: -
Interventions	Interventions: aerobic training + resistance training Comparator: aerobic training
Outcomes	Primary outcome: Secondary outcome: Other outcomes: body mass, BMI, fat mass, visceral and subcutaneous fat, insulin resistance
Study identifier	-
Official title	HOMA-AD: the role of different types of physical exercise in obese adolescents
Stated purpose of study	"The purpose of this study was to investigate the effects of different kinds of exercise in the sensitive index predictor of insulin resistance."
Notes	Library cannot provide reference

Cocca 2016

Methods	Type of study: - Allocation: randomised. Intervention model: - Masking: - Primary purpose: -
Participants	Condition: - Enrollment: 41. Inclusion criteria: - Exclusion criteria: -
Interventions	Intervention : school physical activity based on tactical ball games (4 × 60-minute sessions/week), and attended meetings of nutritional counselling with their families (1 hour/week) Comparator : regular school physical education
Outcomes	Outcomes: cholesterol, HDL cholesterol, triglycerides, waist circumference, blood pressure and glycaemia values Primary outcome: Secondary outcome:

	Other outcome:
Study identifier	-
Official title	Effects of a school-based intervention program on metabolic syndrome parameters in school-aged youth
Stated purpose of study	"The aim of this study was to assess the impact of a school intervention program on the parameters of MetS [metabolic syndrome] in Mexican secondary school students."
Notes	Unclear whether all participants were overweight or obese at baseline and focus of study is on metabolic syndrome rather than weight loss. No data, only P values and most of the outcomes are cardiovascular disease risk factors rather than weight. Contacted author (12 January 2017) to clarify inclusion criteria of participants, aim of the study and weight outcomes

Garrett 1979

Methods	Type of study: - Allocation: - Intervention model: - Masking: - Primary purpose: -
Participants	Condition: obesity Enrollment: - Inclusion criteria: aged 11-16 years, females. Exclusion criteria: -
Interventions	Intervention: - Comparator: -
Outcomes	Primary outcome: - Secondary outcome: - Other outcome: -
Study identifier	-
Official title	Group behavioural therapy versus family behavioural therapy in treatment of obese adolescent females
Stated purpose of study	-

	and leptin
Study identifier	-
Official title	Anti-obesity effect of comprehensive diet and sports in girl students with simple obesity or overweight
Stated purpose of study	To investigate the effective antiobesity therapy with comprehensive diet prescription and sports for girl students with simple obesity and overweight
Notes	Article in Chinese, lack of resources to translate. Contacted author (11 August 2015) for an English version

Makkes 2015

Methods	HELIOS study Type of study: efficacy Allocation: randomised Intervention model: parallel assignment Masking: none Primary purpose: treatment
Participants	Condition : obesity Enrollment : 80 Inclusion criteria : children and adolescents aged 8-18 years referred to Heideheuvel by their own paedia- trician. They must have BMI-SDS ≥ 2.3 according to the growth curves based on the 4th Dutch National Growth Study of 1997 (this corresponds to the 99th percentile) and comorbidity related to obesity (e.g. obstructive sleep apnoea syndrome, raised insulin, diabetes type 2, liver function disorders, dyslipidaemia, worn out joints) or a BMI-SDS ≥ 3.0 (this corresponds to the 99.9th percentile) Exclusion criteria : having syndromal or chromosomal determined obesity, obesity caused by endocrine disorders (hypothyroidism, Cushing's syndrome, primary hyperinsulinaemia, pseudohypoparathyroidism, acquired (structural) hypothalamic damage) or medicine use (e.g. oral steroids, antiepileptic drugs, antide- pressants), severe psychiatric problems, an IQ < 75 or similar school level or if their parents are not willing to participate in the treatment
Interventions	 Intervention A: intensive combined behaviour changing inpatient treatment for 6 months during week-days, followed by biweekly hospital admissions of 2 days for 4 months Intervention B: intensive combined behaviour changing inpatient treatment for 2 months during week-days, followed by biweekly return visits of 2 days during the next 4 months, then followed by 6 monthly return visits of 2 days Comparator: usual care: will receive usual care for 1 year, after which the participants will be randomly allocated to the groups A and B
Outcomes	Primary outcome: BMI-SDS (costs of treatment per change in relative BMI) Secondary outcomes: psychological and psychosocial data on issues such as motivation, competence, self- esteem, anxiety and mental stress; cardiovascular risk factors (blood pressure, serum lipids, liver function tests, glucose and insulin); waist circumference; dietary behaviour; eating behaviour, physical activity (sedentary behaviour); quality of life (generic, weigh-specific and health-related quality of life) Other outcome: -

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 143 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Makkes 2015 (Continued)

Study identifier	NTR1678.
Official title	Health effects of behaviour changing interventions in obese children and adolescents study (Helios) - a randomised controlled trial
Stated purpose of study	Quote: "to compare the cost-effectiveness of these two intensive one-year inpatient treatments to each other and to usual care for severely obese children and adolescents."
Notes	Study only intended to compare the 2 active interventions. The thesis states that for 'logistical reasons' they randomised to a wait list control group, review authors assumed as they were only able to take a small number of participants through the interventions at any 1 time. They also randomise to the groups in 2 batches so that every 6 months for 2 years they start a new intervention 1 and 2 with 10 participants each. The flow chart and number of participants do not show the wait list control group but include them when they are included in intervention A and B. There is 1 analysis for the 3 groups (6 and 12 months only as appropriate) which was described as an "additional analysis." For the purpose of the review, the comparison with the wait list control would be relevant; however, there are no numbers included in the analysis, no baseline characteristics and the only data for BMI-SDS is from a figure. Awaiting further clarification from author or publication of the data to know if this group will be analysable
NCT00462267	
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel assignment Masking: single blind (outcomes assessor) Primary purpose: treatment
Participants	Condition: obesity/overweightEnrollment: 215Inclusion criteria: aged 13-15 years, $BMI \ge 90\%$, 1 or both parent(s) willing to participate in studyassessments and parent sessionsExclusion criteria: $BMI \ge 99\%$, significant cognitive impairment, pregnant, congenital heart disease thatlimits activity, serious asthma requiring oral prednisone, taking medications that increase appetite
Interventions	Intervention : enriched behaviour changing intervention, multicomponent group teen and parent sessions, individual telephone-based coaching contact and a distinct collaborative care component with follow-up visits to the youth's primary care provider Comparator : usual care
Outcomes	Primary outcome: BMI z score Secondary outcomes: quality of life, self-esteem, depression, unhealthy eating practices, weight and shape
	concerns, sociocultural attitudes toward appearance, satisfaction, dietary intake, personal and family eating patterns, physical activity, sedentary behaviours, personal and family physical activity patterns Other outcome : -
Study identifier	patterns, physical activity, sedentary behaviours, personal and family physical activity patterns

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 144 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT00462267 (Continued)

Stated purpose of study	"Examine the effectiveness of a primary care based intervention to help overweight teen girls adopt healthy lifestyle practices."
Notes	Contacted author (6 August 2015), author reply: "The study you identified was a small pilot that supported the larger trial published in <i>Pediatrics</i> (included in this review). Unfortunately, we don't have analytic resources to provide more detail than what is available in the paper itself."

NCT00475163	
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel assignment Masking: open label Primary purpose: prevention
Participants	Condition: obesity Enrollment: 34 Inclusion criteria: aged 13-17 years, able to participate in physical activity Exclusion criteria: on medications that could affect weight
Interventions	Intervention : weekly contacts with mentors to improve physical activity pattern, self-esteem and weight loss in obese teenagers over a 6-month period Comparator : -
Outcomes	Primary outcomes: weight gain, fitness, self-esteem Secondary outcome: Other outcome:
Study identifier	NCT00475163.
Official title	Mentors in motion: a physical activity intervention for obese adolescents
Stated purpose of study	Assessing the impact of mentoring on the behaviour changing choices of adolescents who are overweight
Notes	Study listed as completed on Clinical Trials.gov, but no study results available (last checked 16 August 2016). Contacted authors (7 August 2015) for published/unpublished data, author response (15 September 2015) : data had not been published and the work is still pending (no results available, checked 21 November 2016)

	contraindications to perform physical activity; required to own a PlayStation® 2 or 3 gaming console but not the EyeToy TM or Dance Mat technology Exclusion criteria : if they already own active video games or have a medical condition that would prohibit exercise
Interventions	Intervention : eGAME: a USB motion-capture camera to place a picture of the gamer onscreen. The gamer then interacts with the images on screen. The upgrade consisted of an EyeToy [™] camera, dance mat and a selection of active video games. Children encouraged to meet physical activity recommendations to perform 60 minutes of moderate-to-vigorous physical activity on most days of the week by supplementing periods of inactive with active video game play and substituting periods of inactive video game play with the active version Comparator : control group: continue normal video game playing and physical activity behaviour. At the end of the study, received the active video games upgrade package
Outcomes	 Primary outcomes: change in BMI z score and centile Secondary outcomes: % body fat, waist circumference, physical fitness, PAQ-C score, mean daily time spent in light-to-vigorous activities (minutes), mean daily time spent in active video games (minutes) and mean daily time spent in non-active video games (minutes) Other outcomes: mean daily time spent in light activities (minutes), moderate activities (minutes) and vigorous activities (minutes); psychological variables intention, self-efficacy, barrier efficacy, perceived competence, perceived enjoyment; and mean daily total energy consumed from snacks (kJ)
Starting date	Study start date: 2008 Study completion date: unclear
Contact information	Responsible party/principal investigator: University of Auckland/Ralph Maddison
Study identifier	ACTRN12607000632493
Official title	Active video games to improve body composition and physical activity in children
Stated purpose of study	Quote: "to determine the effects of an active video game intervention over 6 months on: body mass index (BMI), percent body fat, waist circumference, cardio-respiratory fitness, and physical activity levels in overweight children."
Notes	Contacted author (22 October 2015) for anticipated study completion data

ACTRN12611000139976

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: blinded, masking used.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 147 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

ACTRN12611000139976 (Continued)

Participants	 Condition: overweight and obesity (≥ 85th centile) Enrollment: 570 Inclusion criteria: aged 12-17 years; overweight or obese (≥ 85th centile) according to the age- and gender-specific BMI data from the International Obesity Task Force; Internet access at home or at a location where regular use is possible (i.e. school, library). Recruitment will be restricted to those living in the Melbourne metropolitan area (to facilitate complete follow-up assessments by maximising opportunities to collect height and weight data, and to contain study costs) Exclusion criteria: young people with a known endocrine or chromosomal cause for their obesity; taking prescription medication resulting in weight changes (e.g. prednisolone); complications of overweight that contraindicate moderate physical activity (e.g. orthopaedic disorders); past or current medical diagnosis of a clinical eating disorder (i.e. anorexia or bulimia nervosa, binge eating disorder) or significant health disability or condition which prevents participation
Interventions	Intervention : Internet-based programme for 12 weeks, 1 session per week for self-directed 30-60 minutes. Goals will be set by the participant from a framework recommended within the programme (e.g. to increase moderate activity from 0 to 30 minutes on most days) and reviewed every week, activities will be specific to intervention group but not to each individual. Participants will receive a pedometer and a walking programme to help achieve goal of 60 minutes of moderate-to-vigorous activity per day. Cognitive behaviour aspect of the programme will address self-monitoring, goal setting, stimulus control, social eating, etc Participants will receive feedback at least weekly. Parents of participants will be sent monthly newsletters for the 3 months of the intervention programme with tips on creating a supportive environment. After the 12-week programme is finished, participants will receive monthly follow-up via text or e-mail asking them to review their eating and physical activity habits, and provide feedback. They can also review the materials from the programme Comparator : publicly available generic health information about healthy eating and physical activity at start of 12 weeks treatment period. Information will be presented in both paper and online format (e. g. participant will receive a pack with flyers about the physical activity requirements, healthy eating and planning healthy meals and a sheet with links to websites about the age appropriate healthy eating, physical activity and mental health). No cognitive behaviour element
Outcomes	Primary outcome : reduction in BMI z score Secondary outcomes : waist circumference, % body fat, blood pressure, psychological distress, quality of life, eating disorder, programme content satisfaction questionnaire Other outcome : adherence
Starting date	Study start date: July 2011 Study completion date: actual date last participant enrolled: 1 October 2013
Contact information	Responsible party/principal investigator : Joanne Williams, The Royal Children's Hospital, Victoria, Australia
Study identifier	ACTRN12611000139976
Official title	Staying fit adolescent weight management study
Stated purpose of study	Quote: "Staying Fit has been designed as an Internet-based adolescent weight management program for overweight or mildly obese Australian young people. Goals of the program include: targeting weight loss, promoting weight maintenance, decreasing weight and shape concerns, healthy eating and increasing

ACTRN12611000862943

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: open (masking not used) Primary purpose: treatment
Participants	Condition: obesity Enrollment: 107 Inclusion criteria: males and females aged 5-16 years; BMI ≥ 98th centile, or > 91st centile with weight- related comorbidities. Ready for change as assessed by questionnaire and overall assessment of level of motivation by Healthy Lifestyles Co-ordinator on interview. Committed family member Exclusion criteria: significant comorbidities (i.e. any medical condition serious enough to make it impos- sible for a child/adolescent to embark on a programme of increasing physical activity)
Interventions	Intervention : physical activity - fitness assessments and knowledge of importance of physical fitness at 0, 6, 12, 18 and 24 months. Initial home visits by Active Families co-ordinator (1 hour), then weekly activity sessions for 40 weeks during the year (1.5 hours per session). Dietary education - dietitian input and initial home visits (1 hour). Psychology input - input as group at commencement of intervention (2 × 1-hour sessions), and then at family/individual level as indicated Comparator : brief dietary education by means of pamphlet
Outcomes	Primary outcomes: BMI-SDS; quality of life; physical activity Secondary outcomes: dietary behaviour; sedentary activity; glycaemic control Other outcome: -
Starting date	Study start date: 9 January 2012 Study completion date: -
Contact information	Responsible party/principal investigator: Yvonne Anderson; Child and Adolescent Centre, Taranaki Base Hospital
Study identifier	ACTRN12611000862943.
Official title	The effect of a multi-disciplinary obesity intervention compared to usual practice in those ready to make lifestyle changes: design and rationale of Whanau Pakari
Stated purpose of study	Quote: "to improve local obesity services for 5-16 year olds in the Taranaki region, and assess whether the devised intervention programme shows benefits in those participants that are assessed as ready to make healthy lifestyle changes."

Notes

Recruitment status: active, not recruiting. Contacted author (17 January 2017) for trial status

Trial name or title	Acronym: -
Methods	Type of study : efficacy study Allocation : randomised block design will be used. Obese participants will be randomised to 1 of 3 groups and will be stratified according to age and gender Intervention model : single blind (outcome assessors) Primary purpose : effect on myocardial function
Participants	Condition: obesity Enrollment: 100 Inclusion criteria: BMI > 95th percentile (age and gender specific), children and adolescents aged 7-16 years Exclusion criteria: hypertension (defined as blood pressure > 95th centile for systolic or diastolic values), any history or evidence of heart disease or an abnormal resting or stress echocardiography which indicates it would be unsafe to participate (or both), any chronic disease (e.g. chronic asthma, kidney disease, diabetes, current smoking habits or an orthopaedic/neurological disorder that may limit ability to exercise) , diagnosed attention deficit hypersensitivity disorder and use of steroid medications
Interventions	 Intervention 1: high-intensity interval training. Walk, run or cycle at 85-95% of their maximal heart rate at intervals of 4 × 4 minutes, with 3-minute active breaks (~ 60% of maximal heart rate) between intervals. Total exercise time 40 minutes Intervention 2: moderate-intensity exercise. Walk, run or cycle continuously at 70% maximal heart rate for approximately 44 minutes to equalise the energy expenditure performed by high-intensity interval training group. Total exercise time 50 minutes Common across interventions: dietary education sessions that will parallel sessions provided to those assigned to the control group. 30-minute session every second week for 3 months, followed by 1 session every 2 months for the next 9 months. Exercise training 3 times per week for 12 months. Months 1-3, 2 supervised sessions in the gym and 1 session at home. Months 4-12, all training at home. Consists of walking or running on a treadmill, or on a bike for the older children Comparator: control: dietary education sessions, 8-10 × 20-minute individual diet intervention sessions over 12 months. A session every second week for 3 months, followed by 1 session every 2 months for the active session sessions, 8-10 × 20-minute individual diet intervention sessions over 12 months.
Outcomes	Primary outcome: myocardial function (peak systolic tissue velocity) Secondary outcomes: vascular function (flow-mediated dilation assessment), quantity of visceral and sub- cutaneous adipose tissue, myocardial structure and function, body composition, cardiorespiratory fitness, autonomic function, blood biochemistry, physical activity and nutrition Other outcome: -
Starting date	Study start date : October 2013 Study completion date : January 2015 (last participant enrolled)
Contact information	Responsible party/principal investigator : The University of Queensland/Norwegian University of Science and Technology

Official title	Effects of exercise intensity and nutrition advice on myocardial function in obese children and adolescents: a multicentre randomised controlled trial study protocol
Stated purpose of study	Quote: "The primary aim of this randomised controlled trial is to compare the effectiveness of three 12-month interventions: HIIT [high-intensity interval training] and nutrition advice, MICT [moderate-intensity exercise] and nutrition advice or nutrition advice alone on myocardial function in obese children and adolescents."
Notes	Study is ongoing, but not recruiting participants (last updated: 4 January 2017)

ACTRN12615000558527

Trial name or title	Acronym: -
Methods	Type of study: efficacy Allocation: randomised Intervention model: cluster randomised controlled trial Masking: blinded (masking used) outcome assessors Primary purpose: prevention
Participants	Condition: overweight, obese Enrollment: 570 Inclusion criteria: sites: participating in standard Go4Fun programme in 2015; 2014 attendance mean of at least 20 children per programme per term. Participants: males and females aged 7-13 years with no comorbidities; BMI > 85th percentile for their age and gender (according to Australian Institute of Health and Welfare classification of overweight/obesity in children); be enrolled in and meet the general criteria to participate in the Go4Fun programme at 1 of the sites participating in this study which includes having a parent or adult carer able to accompany them to each session Exclusion criteria: sites: not willing to participate in a trial and adhere to standardised procedures for duration of the trial. Participants: parent/guardian not willing to provide written and informed consent
Interventions	 Intervention: Go4Fun programme is a community-based, multidisciplinary family-focused programme and will also be eligible to receive incentives for reaching certain levels of attendance and for goal attainment. Children will receive a skipping rope for attending 80% of programme sessions (8 sessions) and a frisbee for 100% attendance (10 sessions) Once the goals are achieved children are eligible to receive agreed incentives as follows; a vegetable slicer once 2 goals are achieved, a USD10 Rebel voucher once 4 goals are achieved and a height adjustable tennis set (Totem Tennis) once 6 goals are achieved Comparator: standard community weight management programme (namely Go4Fun) without the structured behaviour incentives
Outcomes	Primary outcome : BMI z score Secondary outcomes : waist circumference z score; BMI; difference in rate of attendance at programme sessions between intervention and control sites; difference in mean rate of nutrition goal attainment between intervention and control groups; difference in mean rate of physical activity goal attainment between intervention and control groups

Study identifier	ACTRN12615000558527
Official title	The effectiveness of a community weight management program with a behavioural incentive scheme compared to participation in a standard community weight management program in overweight children on relative weight loss and behaviour change
Stated purpose of study	Quote: "to determine the effectiveness of enhanced goal setting linked to a structured incentive scheme designed to improve the sustained health and wellbeing of overweight/obese children within the context of an existing community-based program."
Notes	As of 1 July 2015, recruitment has commenced and follow-up assessments are ongoing. No data cleaning or analysis of results had begun at the time of this submission (protocol publication 2016)

Chew 2016

Trial name or title	Acronym: LITE
Methods	Type of study: efficacy study Allocation: randomised Intervention model: parallel assignment Masking: - Primary purpose: treatment
Participants	Condition: obesity Enrollment: 60 Inclusion criteria: adolescents 10-16 years referred to the Weight Management Clinic Exclusion criteria: -
Interventions	Intervention : the LITE (Lifestyle Intervention for obese teenagers) group programme is a 6-month, family- based behavioural lifestyle intervention, specifically designed to treat obesity in adolescents 10-16 years Comparator : usual care
Outcomes	Outcomes: outcome measurement are assessed at 3 and 6 months postbaseline and include anthropomet- ric measurements, physical activity, dietary intake, metabolic profile, improvement in positive parenting behaviour and measurement of family support Primary outcome: not clearly stated Secondary outcome: not clearly stated Other outcome: -

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 152 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Official title	The LITE randomised controlled trial
Stated purpose of study	Quote: "This study was designed to address the gap in service provision of a family based weight manage- ment program for overweight and obese adolescents. The LITE (Lifestyle Intervention for obese teenagers) group program is a 6-month, family-based behavioural lifestyle intervention, specifically designed to treat obesity in adolescents 10-16 years referred to the Weight Management Clinic."
Notes	Journal abstract. Data presented for BMI z score at 3 months but not 6 months. High attrition from both groups. Contacted author (12 January 2016) for 6 months' data

ChiCTR-TRC-13003501

Trial name or title	Acronym: -
Methods	Type of study: efficacy study Allocation: randomised Intervention model: parallel Masking: - Primary purpose: treatment
Participants	 Condition: obesity with non-alcoholic fatty liver disease Enrollment: 56 Inclusion criteria: postpubertal Chinese adolescents aged 14-18 years with primary obesity attending the Obesity and Lipid Disorder Clinic in Prince of Wales Hospital Exclusion criteria: hepatic viral infection, daily usage of alcohol, from parental or self-report BMI < 95th centile of local reference, using steatogenic or anti-diabetic drugs (or both), concurrent participation in any clinical trial, dietary intervention or weight loss programme, concomitant intake of a weight-reducing agent, any chronic medical illness, unwillingness to attend regular follow-up appointments
Interventions	Intervention : behaviour changing intervention with modification of diet, physical activity and behaviour patterns, consisting of counselling sessions weekly and then bi-monthly for 1 year. Sessions 15-20 minutes long, taken by dietitians/nutritionists. Also motivational interviewing, such as discussing barriers to lifestyle change and child's and parents' feelings about the progress. Provided with a booklet for portion size exchange and tips for eating out Comparator : conventional care with follow-up in the Obesity and Lipid Disorder Clinic every 16 weeks
Outcomes	Primary outcomes : not stated as primary/secondary: the degree of change of intrahepatic triglyceride con- tent of non-alcoholic fatty liver disease after intervention; anthropometric measurements: height, weight, body fat and waist circumference; blood tests: plasma fasting glucose, lipid profile, plasma alanine amino- transferase, aspirate aminotransferase and serum insulin Secondary outcome : -

	Other outcome: -
Starting date	Study start date: August 2013 Study completion date: unclear
Contact information	Responsible party/principal investigator: Dorothy Chan, The Chinese University of Hong Kong
Study identifier	ChiCTR-TRC-13003501
Official title	Behaviour changing intervention in obese Chinese adolescents with nonalcoholic fatty liver disease: a randomized controlled study
Stated purpose of study	Quote: "A lifestyle modification programme (LMP) developed by the Centre for Nutritional Studies of The Chinese University of Hong Kong for the treatment of obesity and obesity-related diseases. It is clinically proven and developed based on motivational interviewing and behavioural modification, to accompany improving knowledge regarding diet and exercise. Lifestyle intervention with modification of diet, physical activity and behaviour patterns that have been shown to be effective among adults could reduce the severity and prevalence of nonalcoholic fatty liver disease (NAFLD) in obese children and adolescents."

DRKS00004583

Trial name or title	Acronym: TeAM (Telephone counselling as Adiposity Management)
Methods	Type of study: efficacy Allocation: randomised Intervention model: parallel assignment Masking: - Primary purpose: treatment (maintenance)
Participants	Condition: obesity Enrollment: 150 Inclusion criteria: aged 14-18 years, completion of a structured inpatient obesity therapy programme (4- 6 weeks of inpatient treatment) Exclusion criteria: current involvement in weight loss treatment, psychiatric conditions interfering with participation (e.g. eating disorder, psychosis), medication interfering with participation or weight mainte- nance, underlying chronic disease interfering with weight maintenance
Interventions	Intervention 1: telephone counselling and tailored SMS messages Intervention 2: telephone counselling, tailored SMS messages and in addition access to a password- protected web-forum for interaction with other participants Comparator: no intervention, medical care as usual
Outcomes	Primary outcome : BMI-SDS Secondary outcomes : sociodemographics, psychosocial status (KIDSCREEN, self-image scale), daily physical activity, leisure time habits (MoMo Questionnaire) and eating behaviour (DEBQ-C, FFQ) usage of health services (EQ-5D)

Official title	Feasibility of a media-supported high-intensity interval training program for overweight and obese adoles- cents
Stated purpose of study	Quote: "The present study aims to evaluate a) The feasibility of a six months high intensity interval-training program for overweight or obese adolescents and b) Whether motivation to participate in and to adhere to a six months high-intensity interval-training program can be increased by regular, tailored text messages and the support of a password-protected webpage with participant profile for individualized feedback."
Notes	Follow-up ongoing (according to trial record, accessed 16 August 2016)
DRKS00007879	
Trial name or title	Acronym: SRT-Joy
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel assignment Masking: blinded (participants, study personnel, outcome assessors) Primary purpose: treatment
Participants	Condition: obesity Enrollment: 226 Inclusion criteria: males and females, aged 8-16; BMI > 97th percentile; informed consent by parents Exclusion criteria: secondary obesity, hyperkinetic disorder with medication, mental retardation
Interventions	Intervention : self-regulation training with the developed computer program (Approach-Avoidance-Training). The training will be an add-on to the treatment as usual (inpatient rehabilitation treatment). The training will take place on 6 sessions for 10-15 minutes each, spread over 2 consecutive weeks Comparator : will receive a placebo training. This is a similar computer program as the intervention programme but with the difference that no learning effect will occur. The training will be an add-on to the treatment as usual (inpatient rehabilitation treatment). The training will be an add-on to the treatment as usual (inpatient rehabilitation treatment). The training will be held on 6 sessions for 10-15 minutes each, spread over 2 consecutive weeks
Outcomes	Primary outcome : BMI-SDS Secondary outcomes : self-regulation skills of the children, weight-specific self-efficacy, dietary intake Other outcome :
Starting date	Study start date : treatment allocation 7 April 2015 to 30 September 2015 Study completion date : 12-month analysis estimated to be complete 31 December 2016

NCT00850629

Trial name or title	Acronym: MAINTAIN
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel assignment Masking: open label Primary purpose: treatment
Participants	Condition: weight regain Enrollment: 77 Inclusion criteria: aged 10-17 years; primary adiposity at recruitment with a BMI > 97th percentile; willingness of candidates and their families to actively participate in the 3 parts of the study: residential weight reduction programme (participants who stay about 24 days, on average, at least 4-week treatment programme focusing in behaviour changing change, physical activity and healthful eating) Exclusion criteria: participation in another clinical trial or intake of experimental medication within 30 days before the inclusion date, personal relationships or dependencies between participants and study team, severe chronic diseases that were incompatible with the planned intervention (i.e. severe damage of liver or kidney, clotting disorder, psychological or psychiatric disorders, systemic infections, endocrine diseases as well as malabsorption, food allergies or special diets, pregnancy)
Interventions	Intervention : initial weight loss at a residential weight reduction programme. 1-year group multiprofessional behaviour changing intervention with monthly meetings at the paediatric outpatient obesity clinic following BABELUGA (Berlin Adiposity Therapy Program for children and adolescents and their families) behaviour changing monitoring map (behaviour changing counselling) Comparator : initial weight loss at a residential weight reduction programme. Received usual medical care, but no particular programme (as the intervention group throughout the whole year)
Outcomes	Primary outcome: change in age- and gender-adjusted BMI z score Secondary outcomes: change in age- and gender-adjusted waist circumference percentile, change in age- and gender-adjusted blood pressure percentile, change in fasting lipid profile, change in fasting insulin and fasting glucose, change in plasma visfatin level, change in plasma adiponectin level, proportion of children achieving a BMI < 85th percentile for age and gender Other outcome: -

NCT00881478 (Continued)

Official title	Family intervention for obese children using portion control strategy (F.O.C.U.S.) for weight control - a randomized controlled trial
Stated purpose of study	Quote: "The purpose of this study is to assess the efficacy of a family intervention using a portion control tool to help control weight in obese children. The investigators hypothesize that the use of portion control tools by the parents and child will result in a greater decrease in the child's BMI over a 6 month period compared with the control group."
Notes	Last update: 29 August 2014

NCT00940966

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: treatment
Participants	 Condition: elevated triglycerides, systolic hypertension, insulin resistance, abdominal obesity Enrollment: 40 Inclusion criteria: aged 13-18 years, BMI > 95% for age or > 30 kg/m² for young adults, with pre-existing metabolic syndrome Exclusion criteria: on any chronic medication other than antihistamines, asthma medications, oral contraceptives or diabetes medications; smoke > 5 cigarettes/day; alcoholism or drug abuse; significant abnormality not associated with metabolic syndrome; currently taking Byetta; familial hypercholesteremia if the investigator considers the history to be severe; pregnant or desiring pregnancy
Interventions	Intervention : non-energy restricted controlled carbohydrate programmes: energy-restricted very-low carbohydrate diet; low glycaemic index diet; restricted ketogenic diet Comparator : standard American Diabetes Association diet
Outcomes	Primary outcome: weight loss Secondary outcome: - Other outcome: -
Starting date	Study start date: July 2006 Study completion date: May 2012
Contact information	Responsible party/principal investigator: WVU department of paediatrics/Steven Sondike MD
Study identifier	NCT00940966.
Official title	A pilot study to determine the efficacy of a low carbohydrate diet in treatment of adolescents with metabolic syndrome

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 165 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT00940966 (Continued)

Stated purpose of study	Quote: "to determine the effectiveness of two different non-energy restricted controlled carbohydrate programs with the American Diabetes Associations' diet on glycosylated hemoglobin and other diabetes risk factors in obese adolescents with metabolic syndrome, a constellation of symptoms associated with the development of type 2 diabetes and cardiovascular disease."
Notes	Trial status completed (according to trial record, accessed 17 August 2016). Contacted author (5 August 2015) for study completion date. Recontacted (6 October 2016) for results/publication

NCT00998413

Trial name or title	Acronym: Mikado (Multifactorial intervention for children with asthma and overweight)
Methods	Type of study:interventional Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: prevention
Participants	Condition : asthma, overweight, obesity Enrollment : actual 104 Inclusion criteria : asthma and overweight (BMI-SDS > 1), aged 6-16 years, living in Southern Limburg Exclusion criteria : congenital malformations of the airways or other chronic lung diseases like cystic fibrosis, mental retardation or syndromes, heart disease
Interventions	Intervention : multifaceted family-based, physical exercise, nutrition, cognitive behavioural therapy, parental sessions and individualised counselling for 18 months. Small groups of 8-12 children. Based on health counselling model. Group exercises (twice per week during initial phase, 3 times per month during the follow-up phase), with a duration of 60 minutes per session guided by an experienced paediatric physiotherapist or a paediatric sport instructor. A dietitian and psychologist guide 18 behaviour changing sessions with a duration of 75-90 minutes. Use a workbook with additional information for each behaviour changing session, homework and space for individualised goal setting. Small presents as incentives for participation and achievements. 3 basic dietary guidelines: healthy food choice, regular eating pattern, and normalised portion sizes. Children receive individualised counselling sessions. Parents follow 10 parental sessions of 60 minutes guided by the dietitian and psychologist General Practitioners and the Paediatric Pulmonology section of the Dutch Society of Paediatrics
Outcomes	Primary outcomes : forced expiratory volume in 1 second (FEV ₁ %) predicted value, BMI-SDS Secondary outcomes : lung function parameters, inflammatory parameters, asthma control, medication use, asthma symptoms, health-related quality of life, asthma-related quality of life, sleep-related breathing disorders, gastro-oesophageal reflux disease, psychosocial problems, eating behaviour, weight, height, BMI) , waist and hip circumference, 4-fold skinfold measurement, food record, accelerometer output Other outcome : -
Starting date	Study start date: January 2010 Study completion date: September 2013
Contact information	Responsible party/principal investigator: Maastricht University Medical Center/Edward Dompeling

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 166 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT00998413 (Continued)

Study identifier	NCT00998413.
Official title	Secondary prevention of asthma in overweight/obese children by a combined dietary-behavioural-physical activity intervention
Stated purpose of study	Quote: "to determine the efficacy of a multifactorial intervention with weight reduction, behavioural therapy, and physical exercise on the severity and control of asthma in obese children."
Notes	Trial status completed (according to trial record, accessed 17 August 2016). Contacted author (22 October 2015) for study completion date but e-mail error. Recontacted (6 October 2016) and e-mail error

NCT01023139

Trial name or title	Acronym: AOS
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel assignment Masking: open label Primary purpose: treatment
Participants	 Condition: overweight Enrollment: estimated 100 Inclusion criteria: BMI ≥ U. weighted mean of the 95th percentile based on age and gender; willing to lose weight to meet and continue study medication for the 12-month treatment period and meet personal weight loss goal; willing to not start any new weight loss products; males or non-pregnant females (pregnancy determined by self-report); females of childbearing potential if practicing acceptable method of contraception Exclusion criteria: weight loss ≥ 10 lb in previous 3 months; active gastrointestinal disorders (except gastro-oesophageal reflux disease); at least 2 out of 3 blood pressure readings either systolic or diastolic ≥ 95 percentile for height and age or pulse ≥ 95 beats per minute at initial visit; drug-treated diabetes mellitus or hypertension; drugs or supplements (or both) administered for the first time or withdrawn during the past 6 months which have a significant impact on body weight or digestion; inability or unwillingness to comply with protocol requirements; unwilling to avoid consumption of alcoholic beverages; smoking or has started a smoking cessation programme within the past 6 months; previous treatment with prescription sibutramine; history of recurrent nephrolithiasis; major psychiatric or eating disorders; kidney, liver or thyroid disorder; drugs that are contraindicated; cardiovascular disease; history of bleeding problems, migraine headaches or seizures; stroke; history of pulmonary hypertension, osteopenia or osteoporosis; current recreational drug use or overused prescription medications; history of glaucoma; pregnancy
Interventions	Intervention : continuing behavioural therapy. Study uses a multidisciplinary approach along with phar- macotherapy (use of Meridia) to motivate and establish behaviour changes in adolescents (aged 12-18 years) during the first phase of the study. The group will continue on monthly behaviour modifications and be evaluated at 3 and 6 months. This arm follows the end of the phase 1 which incorporates behavioural therapy, nutrition counselling and pharmacotherapy with sibutramine while medically supervised. Partic- ipants randomised to this arm no longer receive medication and will receive behavioural therapy once per month and then evaluated at 3 and 6 months for weight loss maintenance Comparator : no intervention: standard of care. No intervention following phase 1 of the study done

NCT01023139 (Continued)

	during this 2nd phase. Participants have their height and weights examined at 3 and 6 months following end of phase 1. During these 2 visits, they receive counselling from the physician regarding food choices and exercise maintenance
Outcomes	Primary outcome: % change in BMI z score Secondary outcomes: absolute weight change, waist circumference change Other outcome: -
Starting date	Study start date: April 2009 Study completion date: March 2011
Contact information	Responsible party/principal investigator: Brooke Army Medical Center/Jorge L Cabrera
Study identifier	NCT01023139.
Official title	Efficacy in adolescents of continued behavior modification following a six month sibutramine-based weight management intervention
Stated purpose of study	Quote: "This study uses a multidisciplinary approach along with pharmacotherapy (use of Meridia) to motivate and establish behavior changes in adolescents (12-18yo) during the first phase of the study."
Notes	Trial record stated, "The recruitment status of this study is unknown because the information has not been verified recently."

NCT01221220

Trial name or title	Acronym: -
Methods	Type of study: efficacy Allocation: randomised Intervention model: parallel Masking: single blind (outcome assessor) Primary purpose: treatment
Participants	Condition: obesity Enrollment: 160 Inclusion criteria: aged 8-15 years, obese (BMI > 95th percentile on the 2000 CDC BMI reference) on the date of randomisation. Standard Stanford Pediatric Weight Control Program eligibility criteria apply: both child and parent/guardian must want to join, both child and at least 1 parent/guardian must agree to attend sessions and must agree to not miss > 2 consecutive sessions Exclusion criteria: diagnosed with a medical condition affecting growth (a genetic or metabolic disease/ syndrome associated obesity, type 1 diabetes, type 2 diabetes taking medication, chronic gastrointestinal diseases, chronic renal diseases, uncorrected structural heart disease, heart failure, heart transplant, anorexia nervosa or bulimia nervosa or binge eating disorder (present or past), AIDS or HIV infection, pregnancy) ; taking medications affecting growth (systemic corticosteroids > 2 weeks in the past year, insulin, oral hypoglycaemic drugs, thyroid hormone, growth hormone); have a condition limiting their participation in the interventions (e.g. unable to participate in routine physical education classes at school, requiring oxygen supplementation for exertion, developmental or physical disability preventing participation in

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 168 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT01221220 (Continued)

	interventions, children or parents/guardians who cannot medically participate in mild dietary restrictions, increased physical activity for any reason, or a combination of these); have a condition limiting participation in the assessments (child or primary carer unable to read surveys in English or Spanish, child ≥ 2 grade levels delayed in school for reading and writing in his/her native language); unable to read, understand or complete informed consent in English or Spanish; plan to move from the San Francisco Bay Area within the next 18 months
Interventions	Intervention : behavioural treatment + environmental strategies. 6-month, family-based, group, be- havioural weight control programme + home-based environmental intervention Comparator : active comparator: behavioural treatment only. 6-month, family-based, group, behavioural weight control programme
Outcomes	Primary outcome: BMI Secondary outcomes: waist circumference, triceps skinfold, resting heart rate, dietary intake/meals eaten with television, weight concerns, depressive symptoms, daily energy intake, physical activity, systolic and diastolic blood pressure, fasting blood lipids, insulin/glucose metabolism Other outcome: -
Starting date	Study start date: September 2010 Study completion date: February 2015 (estimated)
Contact information	Responsible party/principal investigator: Thomas Robinson Stanford University
Study identifier	NCT01221220.
Official title	Environmental strategies & behavior change to reduce overeating in obese children
Stated purpose of study	Quote: "There is a need for effective weight control methods for obese children. Environmental strategies such as reducing the size of dishware and serving utensils, storing food out of view and reducing food consumption while watching television may reduce food intake without requiring conscious, cognitive self-control. The investigators propose to test these methods when added to a current state-of-the-art behavioral program."
Notes	Trial record stated, "The recruitment status of this study is unknown because the information has not been verified recently" (accessed 17 August 2016)

NCT01350531

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: single blind (outcomes assessor) Primary purpose: treatment

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 169 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT01350531 (Continued)

Participants	Condition: obesity Enrollment: estimated 200
	Inclusion criteria : African-American adolescents, aged 12-16 years and 11 months; obesity (BMI \ge 95th percentile or BMI > 30 kg/m ²); may have primary obesity or obesity in combination with other medical comorbidities; youth with mild mental retardation may be included if they are capable of reading and understanding the study measures
	Exclusion criteria : obesity secondary to medication use for another disorder; obesity in a youth with medical condition that prevents their participation in normal exercise; thought disorders; serious cognitive impairments; pregnant or have a medical condition where weight loss is contraindicated; do not live with their primary carer
Interventions	Intervention: skills training: includes skills most proximal to adhering to the eating and weight loss plan (e. g. calorie counting, making healthy food choices, measuring food portions, scheduling snacks and meals, meal planning, completing food logs daily, following an exercise plan) Comparator: contingency management: behavioural principles to counteract the reinforcing mechanisms of food and inactivity
Outcomes	Primary outcomes: change in weight-related outcomes (height, weight and % body fat) Secondary outcomes: change in adherence to weight loss recommendations (objective measures of car- diovascular fitness, BLOCK Kids FFQ, and the Frequency of Fast Food Use Questionnaire); change in physiological functioning (plasma glucose, insulin, total cholesterol, high-density lipoprotein cholesterol, low-density lipoprotein cholesterol and triglyceride levels); change in motivation (Importance Ruler) Other outcome: -
Starting date	Study start date: September 2009 Study completion date: June 2014
Contact information	Responsible party/principal investigator : Wayne State University/Sylvie Naar-King, PhD and K-L Cathy Jen, PhD
Study identifier	NCT01350531.
Official title	Interventionist procedures for adherence to weight loss recommendations in black adolescents, phase two
Stated purpose of study	Quote: "To refine intervention protocols from our preliminary studies that maximize adolescent and parent skills, informed by learning theory, through the use of home and community-based interventions in which in-vivo opportunities are used to promote practice in making changes in dietary, exercise and sedentary behaviors in AAAO [African-American adolescents with obesity] and their families (PHASE I); To develop intervention protocols that utilize findings from basic science regarding intrinsic and extrinsic motivation to maximize adolescent and family adherence to recommendations for obesity-related behavior change in AAAO and their families (PHASE I); To develop an adaptive intervention using a sequential multiple randomized assignment trial (SMART design) (PHASE II); To refine the intervention including qualitative analysis of interviews from participant families and to develop further community participation in preparation for a confirmatory randomized clinical trial (PHASE III)."
Notes	Trial record stated, "The recruitment status of this study is unknown because the information has not been verified recently" (accessed 17 August 2016)

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 170 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: treatment
Participants	Condition: childhood obesity Enrollment: estimated 100 Inclusion criteria: aged 12-14 years; BMI > 25 kg/m ² ; gender- and age-specific 85th percentile cut-off points from the CDC growth chart; parental consent and subject assent Exclusion criteria: physician-determined musculoskeletal, cardiopulmonary, metabolic, psychological, neurodevelopmental or behavioural conditions that make mild-to-moderate physical activity potentially hazardous
Interventions	Intervention : Exergaming: access to usual physical activity at the gym as well as access to Exergaming equipment (video games that require physical activity). Exergaming equipment will be available for use at the YMCA (Young Men's Christian Association) daily. Exergames include a mixture of aerobic and resistance exercise activities Comparator : usual physical activity at the gym, no access to Exergames
Outcomes	Primary outcome : change in mean daily physical activity Secondary outcomes : change in caloric expenditure, body composition (total body estimates of fat mass, fat-free mass, and lean body mass) and BMI (BMI z score) Other outcome : -
Starting date	Study start date: October 2010 Study completion date: October 2012
Contact information	Responsible party/principal investigator : Charles Drew University of Medicine and Science/David Mar- tins
Study identifier	NCT01374386
Official title	RCMI clinical research infrastructure initiative: exergaming
Stated purpose of study	Quote: "to gather information on how much exercising with video games (ExerGaming) can increase the physical activity among overweight and youth. This study will try to see if participating in physical activity and exercising with video games at the same time can make overweight children move around more to better their own health."
Notes	Trial record stated, "The recruitment status of this study is unknown because the information has not been verified recently" (accessed 17 August 2016)

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 171 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Trial name or title	Acronym: MPOWERed
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: single blind (outcome assessor) Primary purpose: treatment
Participants	Condition: obesity Enrollment: 60 Inclusion criteria: BMI ≥ 95th percentile for gender and age according to CDC growth charts; enrolment in the MPOWER programme; at least 1 parent willing and able to participate in the MPOWER programme with the adolescent; absence of any major medical illness, disability or moderate/severe mental disorder (e. g. liver disease, renal failure, cancer, bipolar disorder) Exclusion criteria: presence of any major medical illness, disability or moderate/severe mental disorder; physical, mental or cognitive handicaps that prevent participation; chronic use of medications that may affect study outcomes; pregnancy or planning pregnancy in the next 6 months; lactating; within 6 months postpartum
Interventions	Intervention : tailored mobile messages to enhance weight loss for teens. Participants receive daily messages over 20 weeks. The content of the messages is tailored on participants' responses to the MPOWER enrolment survey and the initial tailoring questionnaire. The tailored messages utilise various degrees of personalisation, adaptation and feedback - including momentary assessments with feedback requiring a text reply from the adolescents Comparator : participation in the MPOWER programme without receiving tailored text messages
Outcomes	Primary outcomes: session attendance; adherence to MPOWER programme homework assignments; satisfaction with the MPOWER programme; drop-out Secondary outcomes: change in BMI; objective measurement of daily participation in moderate-to-vigorous activity; self-efficacy for achieving MPOWER recommendations for the 6 target behaviours; intrinsic motivation to increase intake of fruits and vegetables and to increase physical activity; change in self-report of the 6 behaviours targeted in the intervention Other outcome: -
Starting date	Study start date: October 2011 Study completion date: February 2015
Contact information	Responsible party/principal investigator: University of Michigan/Susan J Woolford, MD, MPH
Study identifier	NCT01448551
Official title	Novel individually tailored mobile messages to enhance weight loss for teens
Stated purpose of study	Quote: "The investigators hypothesize that program participants who receive the tailored text messages will experience lower attrition rates, increased treatment adherence, and greater weight loss compared to those program participants who do not receive the messages."
Notes	Last updated: 30 November 2015

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 172 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Trial name or title	Acronym: O3WLIRADOL (Omega-3 Fatty Acids for Weight Loss and Insulin Resistance in Adolescents)
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: double blind (participant, investigator) Primary purpose: supportive care
Participants	Condition: obesity, insulin resistance Enrollment: estimated 300 Inclusion criteria: aged 12-18 years; male and female; BMI > 95th percentile of the National Center for Health Statistics reference; informed consent Exclusion criteria: diagnosed with type 2 diabetes mellitus, cardiovascular disease or kidney disease; allergic to fish
Interventions	Intervention : omega 3 supplement (1.1 g of docosahexaenoic acid and eicosapentaenoic acid) containing omega 3: docosahexaenoic acid and eicosapentaenoic acid fatty acids and a hypocaloric diet. 30 capsules provided every month for 3 months. Personalised diet including: reduction of 700 kcal from the usual diet considering lipids and carbohydrates, increasing fruits and vegetables intake up to 6 portions daily each and incrementing the intake of fibre to 30 g per day through the inclusion of whole grains Comparator : sunflower oil supplement and a hypocaloric diet. Personalised diet including: reduction of 700 kcal from the usual diet considering lipids and carbohydrates, increasing fruits and vegetables intake up to 6 portions daily each and incrementing the intake of fibre to 30 g per day through the inclusion of whole grains up to 6 portions daily each and incrementing the intake of fibre to 30 g per day through the inclusion of 700 kcal from the usual diet considering lipids and carbohydrates, increasing fruits and vegetables intake up to 6 portions daily each and incrementing the intake of fibre to 30 g per day through the inclusion of whole grains
Outcomes	Primary outcome : change in insulin resistance Secondary outcome : nutritional status (measured by weight, stature, BMI, waist) Other outcome : -
Starting date	Study start date: July 2012 Study completion date: December 2015
Contact information	Responsible party/principal investigator : Pediatric Hospital CMN "Siglo XXI/Mardia Lopez-Alarcon, PhD
Study identifier	NCT01456221
Official title	The impact of using omega3 long-chain polyunsaturated fatty acids in weight loss and insulin resistance in obese adolescents
Stated purpose of study	Quote: "to evaluate if a supplement containing omega-3 long chain polyunsaturated fatty acids for three months reduce obesity and insulin resistance to obese adolescents if administered together with a hypocaloric diet."
Notes	Last updated: 3 February 2016

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 173 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Trial name or title	Acronym: IMPACT (Ideas Moving Parents and Adolescents to Change Together)
Methods	Type of study: interventional Allocation: randomised Intervention model: single blind Masking: parallel Primary purpose: treatment
Participants	Condition: overweight, obese Enrollment: estimated 360 Inclusion criteria: aged 11-15 years, found at standard school screenings to be overweight (BMI 85-94th percentile for age/gender) or obese (> 95th percentile for age/gender) Exclusion criteria: medications that alter appetite or weight; inability to understand English; stage 2 hypertension or stage 1 hypertension with end-organ damage (left ventricular hypertrophy, microalbu- minuria); severe behavioural problems that preclude group participation (as reported by parent/guardian) ; involvement in another weight management programme; family expectation to move from the region within 1 year; presence of a known medical condition that itself causes obesity (e.g. Prader-Willi syndrome) or interfere with glycated haemoglobin (sickle cell disease)
Interventions	 Intervention 1; HealthyCHANGE: cognitive behavioural strategies to address diet, physical activity, sedentary behaviour and sleep for children. Intensive series of group sessions, followed by rotating monthly face-to-face meetings or telephone calls Intervention 2: SystemCHANGE: system improvement and choice architecture theories seek to teach a set of skills using family self-designed experiments to redesign daily routines regarding eating, activity and sleep. Intensive series of group sessions, followed by rotating monthly face-to-face meetings or telephone calls Comparator: Tools4CHANGE: 1 × 60-minute face-to-face meeting at initiation of the study with a dietitian who is also trained in recommendations for exercise and sedentary behaviour (representing usual care)
Outcomes	Primary outcome : slope of BMI Secondary outcomes : dietary intake, blood pressure, physical activity, sleep, cardiovascular risk factors, body composition, fitness, quality of life, DNA Other outcome : -
Starting date	Study start date: February 2011 Study completion date: December 2017
Contact information	Responsible party/principal investigator : Elaine Borawski, Case Western Reserve University/Leona Cut- tler, MD
Study identifier	NCT01514279
Official title	Targeting obesity and blood pressure in urban youth (consortium title: Childhood Obesity Prevention and Treatment Research [COPTR] and site project name IMPACT (Ideas Moving Parents and Adolescents to Change Together)
Stated purpose of study	Quote: "The project assesses the effects of three interventions on Body Mass Index(BMI) in overweight and obese urban 5th-8th grade youth: a cognitive-behavioral intervention (HealthyChange), a systems

	improvement intervention (SystemsChange), and an education-only intervention (Tools4Change). In ad- dition the study assesses the potential additional impact of a school-community based intervention on outcomes."
Notes	Last updated: 26 January 2016

NCT01677923

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: treatment
Participants	Condition: obesity Enrollment: estimated 400 Inclusion criteria: aged 10-17 years; weight > 85th percentile for age and gender (by International Obesity Task Force); living in Kaunas and its region; no obvious chronic diseases; not on steroid or other long-term treatment; informed consent of the participant and parents Exclusion criteria: diagnosis of type 1 diabetes mellitus; chronic illness that may affect physical activity and metabolic profile; insulin treatment; steroid treatment; planning to move from Kaunas or its region in the period of 1 year
Interventions	 Intervention: intervention duration: 12 months Intervention 1: intensive diet + physical activity group: seen by a dietitian once per month for diet re- evaluation; physical therapist, who will give physical activity course twice per week (1 hour each); paediatric endocrinologist every 3 months Intervention 2: intensive diet + physical activity group + insulin sensitisation: metformin 1000 mg/day. Children seen by a dietitian once per month for diet re-evaluation; physiotherapist, who will give physical activity course twice per week (1 hour each); paediatric endocrinologist every 3 month Comparator 1: insulin sensitisation without intensive diet and physical activity. Metformin 1000 mg/day after standardised information on healthy lifestyle, diet and exercise during the first visit only. Seen by paediatric endocrinologist every 3 months Comparator 2: during the first visit participants get standardised information on healthy lifestyle, diet and exercise. Followed-up at 12 months
Outcomes	Primary outcome: BMI changes Secondary outcomes: glucose homeostasis; lipid profile; metabolic syndrome; hepatosteatosis; polycystic ovary syndrome and hyperandrogenism in females Other outcome: safety
Starting date	Study start date: May 2013 Study completion date: December 2015
Contact information	Responsible party/principal investigator: Lithuanian University of Health Sciences/Rasa Verkauskiene

NCT01677923 (Continued)

Study identifier	NCT01677923
Official title	Phase 3: effect of diet, physical activity and insulin sensitizer metformin on obesity and associated risks in children and adolescents
Stated purpose of study	Quote: "to get better effect of weight decrease and metabolic processes repair in the intensive treatment group with intervention of physical activity, diet correction and Metformin use."
Notes	Trial status completed (according to trial record, accessed 17 August 2016). Contacted author (2 September 2016) for results/publication

NCT01688453

Trial name or title	Acronym: PRALIMAP-INES
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: prevention
Participants	Condition : overweight Enrollment : 1250 Inclusion criteria : attending grade 10 in participating schools; aged \leq 18 years; able to complete a questionnaire; overweight or obese according to the International Obesity Task Force criteria (for BMI) and the McCarthy criteria (for waist circumference), have a high eating disorder score, ,express the need for management of excess weight, or a combination of these; confirmed as corresponding to the inclusion criteria by the physician; agree to an overweight and obesity care management programme Exclusion criteria : -
Interventions	Intervention : strengthened care management: 5 collective sessions with the same standard operating procedure as the standard-care management with supplementary interventions between each session: strength- ened solicitation with the adolescent and the family, peer-led educational sessions, motivational interviews, financial support for physical activity practice, cooking classes and multidisciplinary consultation meetings Comparator : standard-care management: 5 collective sessions of 2 hour each about nutritional practices (food and physical activity) and on changes of nutritional behaviours. The sessions are organised in high schools by the healthcare team in collaboration with paediatricians, dietitians and the Sickness Insurance Primary Fund
Outcomes	Primary outcomes : change in BMI; change in overweight and obesity status; change in BMI Z score Secondary outcomes : change in waist circumference; change in eating attitude score; change in anxiety and depression scores Other outcome : change in nutritional behaviour
Starting date	Study start date: September 2012 Study completion date: September 2015

NCT01794546

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: cross-over Masking: single blind (outcomes assessor) Primary purpose: treatment
Participants	 Condition: paediatric obesity Enrollment: 40 Inclusion criteria: aged 10-17 years; BMI ≥ 95th percentile for age and gender; no known significant obesity comorbidity or cause requiring urgent medical evaluation or treatment in a subspecialty programme other than an obesity programme; no known physical limitations to changes in diet or activity level (i.e. concern for cardiac disease, primary gastrointestinal disease or orthopaedic concerns); patient at Wareham Pediatrics practice Exclusion criteria: unstable home environment; inability to actively participate in treatment; physician diagnosis of a major medical illness or eating disorder; chronic use of any medication or supplement that may affect study outcomes; another member of the family participating in the study; planning to relocate from current area of residence during the proposed time frame for study participation
Interventions	Intervention : telehealth, alternate visits between a dietitian and behavioural medicine provider for either 30 minutes or 1 hour. 12 sessions over 6 months. The dietitian provides dietary and physical activity recommendations, and the behavioural medicine provider counsels on strategies for achieving specific goals. Applying a Chronic Care Model, self-management support will be augmented by linkages to community resources Comparator: wait list control group
Outcomes	Primary outcome: BMI Secondary outcomes: satisfaction, compliance Other outcome: -
Starting date	Study start date: February 2013 Study completion date: January 2015
Contact information	Responsible party/principal investigator: Children's Hospital Boston/Cara B Ebbeling, PhD

NCT01796067

Trial name or title	Acronym: FIT: Families Improving Together
Methods	Type of study: interventional Allocation: randomised Intervention model: factorial Masking: open label Primary purpose: treatment
Participants	Condition : overweight, obese Enrollment : estimated 520 Inclusion criteria : parent or primary carer who lives in the same house; live within 60 miles of the programme's office; \geq 3 grandparents who are African-American; access to the Internet; aged 11-16 years; BMI \geq 85th to < 99th percentile; no medical condition that would limit participation in moderate-intensity exercise including life-threatening illness (e.g. immobile, severely disabled or bed ridden); available and able to participate in measures and intervention activities over the next year Exclusion criteria : chronic illness; require a specialised diet (may not be eligible); developmental delay; partaking currently in another weight loss programme
Interventions	 Intervention: 8-week face-to-face group programme comparing motivational plus family weight loss to a comprehensive health education programme. Then participants undertake either an 8-week online tailored intervention or online control and then participants have online intervention or control booster sessions for 6 months. 4 groups: Group 1: motivational and family weight loss + online intervention Group 2: motivation and family weight loss + online control Group 3: basic health education and online intervention Group 4: basic health education and online control Comparator: see above
Outcomes	Primary outcome : change in BMI (BMI z score) Secondary outcomes : change in moderate-to-vigorous physical activity in parents and adolescents; change of 24-hour dietary recall in parents and adolescents; change in psychosocial variables (autonomy-support, monitoring, communication); change in moderate-to-vigorous physical activity; change of 24-hour dietary recall; change in BMI z score in parents Other outcome : -

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 179 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT01796067 (Continued)

Starting date	Study start date: July 2012 Study completion date: June 2017
Contact information	Responsible party/principal investigator: University of South Carolina/Dawn K Wilson, PhD
Study identifier	NCT01796067.
Official title	Families Improving Together (FIT) for weight loss
Stated purpose of study	Quote: "to test the effects of an integrated intervention curriculum and the added effects of a tailored web- based intervention on reducing z-BMI in overweight African American adolescents."
Notes	Last updated: 19 July 2016

NCT01804855

Trial name or title	Acronym: -
Methods	Type of study: non-inferiority study Allocation: randomised Intervention model: parallel assignment Masking: single blind (outcome assessor) Primary purpose: treatment
Participants	Condition: obesity Enrollment: 134 (126 in trial record) Inclusion criteria: aged 12-17 years, BMI > 98th percentile, fluent in English, parent(s) willing to partic- ipate in the programme, written informed consent and assent prior to any study-specific procedures Exclusion criteria: severe intellectual difficulties which would limit the child's ability to engage in group activity, obesity secondary to genetic condition, limitations to engaging in physical activity or use of medication known to effect body weight, limitations to using a smart phone device and known family issues that would affect general compliance and attendance at follow-up visits
Interventions	Intervention : W82GO (underpinned by behavioural change theory (Transtheoretical Model and social cognitive theory) uses strategies including stimulus control, self-monitoring, positive reinforcement, goal setting and problem solving to facilitate lifestyle change), 6×2 -hour weekly sessions for adolescents and parents followed by randomisation to a maintenance phase, of 3×3 -month booster maintenance sessions over 46 weeks and using a smart phone application: incorporates evidence-based behavioural change tools such as self-monitoring, goal setting and peer support. Evidence-based tips as a text tip, a video tip or an image tip. Aim to increase knowledge with regard to healthy eating, physical activity, physical fitness and sleep. Encouraged to engage in daily goal setting and monitor progress. Monthly telephone calls Comparator : W82GO followed by randomisation to usual care maintenance phase: 3 booster sessions at 3, 6 and 9 months and no smart phone intervention
Outcomes	Primary outcome: BMI z score Secondary outcomes: weight, height, waist circumference, fat mass, physical activity, lipids, glucose, insulin, glycated haemoglobin, psychosocial health, adverse events, health-related quality of life

Starting date	Study start date: 2013 Study completion date: 2014
Contact information	Responsible party/principal investigator : Grace O'Malley, Temple Street Children's University Hospital. Dublin, Ireland
Study identifier	NCT01804855
Official title	Effectiveness of a smartphone app for adolescent obesity management
Stated purpose of study	Quote: "This study will test whether treatment can be delivered via an Android app and whether such treatment reduces obesity."
Notes	Some conflicting information between the protocol and clinical trials record, e.g. sample size and outcomes. Trial record stated, "The recruitment status of this study is unknown because the information has not been verified recently" (accessed 18 August 2016)

NCT01840631

Trial name or title	Acronym: -
Methods	Type of study: intervention Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: treatment
Participants	 Condition: obesity Enrollment: 80 Inclusion criteria: aged 9-17 years, BMI percentile for age of ≥ 95, able to attend monthly sessions with a parent or guardian (or both) Exclusion criteria: diabetes at baseline, mental or psychological disease that would interfere with understanding, disease or medication causing obesity or weight loss, and participants in an alternative weight management programme, impaired glucose tolerance
Interventions	Intervention : group nutritional counselling for a total of 6 classes. Classes meet 1 time per month for 60 minutes (30 minutes for dietetic session and 30 minutes for discussion/questions). Classes cover topics including nutrition, exercise and behaviour to promote healthy eating. All content developed prior to starting the intervention. Each group session have a maximum of 7 children with 1 parent/carer per child and a minimum of 5 children with a carer. All groups receive standard of care for physical fitness counselling which includes recommending 1 hour of physical activity per day and limiting screen time to < 2 hours per day. All groups evaluated for depression and appropriately referred if found to be depressed. Behavioural strategies, such as mindful eating, included in the nutrition education (participants receive the same information in both interventions) Comparator : individual nutritional counselling (usual care): nutritionist conducts the nutritional counselling with 1 family at a time. Individual sessions once per month for 30 minutes for a total of 6 sessions.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 181 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT01840631 (Continued)

	All groups receive standard of care for physical fitness counselling which includes recommending 1 hour of physical activity per day and limiting screen time to < 2 hours per day. All groups evaluated for depression and appropriately referred if found to be depressed. Behavioural strategies, such as mindful included in the nutrition (participants receive the same information in both interventions)
Outcomes	Primary outcome : mean BMI change Secondary outcomes : correlation between change in BMI and dietary composition change, correlation between change in BMI and increased physical activity, effect of change in BMI on metabolic profile Other outcome : -
Starting date	Study start date: April 2013 Study completion date: December 2015
Contact information	Responsible party/principal investigator : Rubina Heptulla, Albert Einstein College of Medicine of Yeshiva University, New York
Study identifier	NCT01840631.
Official title	A randomized controlled trial to Study the effects of group versus individual dietary counseling in pediatric obesity
Stated purpose of study	Quote: "The primary aim of our study is to assess whether group counselling is a non-inferior intervention compared to the usual care of individual counselling in the management of childhood obesity. In order to achieve this aim, the investigators will compare the mean change in BMI after 6 months of intervention in the two study arms."
Notes	Last updated: 24 June 2015

NCT02034994

Trial name or title	Acronym: -
Methods	Type of study: efficacy Allocation: randomised Intervention model: parallel assignment Masking: single blind (outcomes assessor) Primary purpose: prevention
Participants	Condition: obesity but only in second part of the study Enrollment: 1200 Inclusion criteria: secondary prevention programme (relevant to our review): overweight and obese chil- dren, 6th and 7th grades students, consent form signed by parents/tutors Exclusion criteria: pregnant girls
Interventions	Intervention : behavioural: eating behaviour and physical activity change: a combination of 2 prevention school-based programmes addressed to schoolchildren over 1 year. Primary prevention developed monthly to reduce cookies and sugar-sweetened beverage consumption, reduction of sedentary activities, increase meal consumption frequency and quality, etc, in all children from 6th and 7th grades. Overweight and

NCT02034994 (Continued)

	obese children invited to participate on a secondary prevention programme in which daily physical activity classes performed by physical education teachers in school facilities Comparator : no intervention
Outcomes	Primary outcome: BMI Secondary outcomes: mean lean and fatty body mass proportions Other outcomes: sedentary activities, sugar-sweetened beverages intake, cookies intake, fruits intake, physical activity
Starting date	Study start date: February 2014 Study completion date: December 2014
Contact information	Responsible party/principal investigator: Rosely Sichieri, Rio de Janeiro State University
Study identifier	NCT02034994
Official title	Combining primary and secondary prevention for reduction of excessive weight gain in school
Stated purpose of study	Quote: "The main objective is to evaluate the effects of a multicomponent, school-based intervention combining change in nutritional behaviors with after school physical activity activities in reducing the excessive weight gain in schoolchildren."
Notes	Only part 2 of the study is relevant. Trial record stated, "The recruitment status of this study is unknown because the information has not been verified recently" (accessed 18 August 2016)

NCT02086851

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: treatment
Participants	Condition: paediatric obesity Enrollment: 110 Inclusion criteria: aged 11-16 years; BMI > 85th percentile; 1 parent or guardian committed to participate in protocol Exclusion criteria: previous enrolment in IRB3354, IRB3008 or HM11113; underlying genetic, neuro- logical, endocrine or metabolic condition that precludes weight loss with conventional diet and exercise programmes; weight > 400 lb, pregnancy; inability to understand study instructions due to language barrier or mental disability; primary residence outside a 30-mile radius of study location
Interventions	Intervention : behaviour changing intervention + parent motivational interviewing: 6-month intensive behaviour changing modification, includes a structured exercise programme, nutrition education and dietary modification and behavioural support. Followed by a 6-month maintenance phase with monthly booster sessions. Parents participate in 4 dedicated "pre-treatment" parent psychoeducational sessions

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 183 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT02086851 (Continued)

	Comparator: behaviour changing intervention alone (no parent psychoeducational sessions)
Outcomes	Primary outcome : change in BMI z scores Secondary outcomes : changes in body composition, BMI, insulin sensitivity, blood pressure, serum lipids, fitness measures, electrocardiographic parameters, dietary intake, quality of life scores, BMI of participating parents or body composition of participating parents Other outcome : -
Starting date	Study start date: September 2011 Study completion date: August 2015
Contact information	Responsible party/principal investigator: Virginia Commonwealth University/Edmond P Wickham, MD, MPH
Study identifier	NCT02086851
Official title	Impact of a structured parent intervention on weight loss and behavioral change in overweight adolescents enrolled in a lifestyle modification program
Stated purpose of study	Quote: "The study will enroll 110 overweight and obese adolescents ages 11-16 in a lifestyle modification program focusing on dietary modification and exercise. Parents will be randomized into control and motivational interviewing-based intervention groups. The primary hypothesis is that adolescents whose parents are in the intervention group will have improved compliance, weight loss and health outcomes compared with adolescents whose parents do not receive the intervention."
Notes	Trial status completed (according to trial record, accessed 18 August 2016). Contacted author (21 October 2015) for expected publication date

NCT02228278

Trial name or title	Acronym: Text4Fit
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel Masking: open label Primary purpose: treatment
Participants	Condition: paediatric obesity Enrollment: 25 Inclusion criteria: aged 13-17 years; overweight or obese (BMI > 85th percentile); attend or will start attending UF Pediatric Lipid Clinic during the study period; own a mobile telephone that can receive text messages Exclusion criteria: current diagnosis of a psychiatric eating disorder; pregnancy; medical disease that would contraindicate moderate physical activity, as determined by clinician from the Lipid Clinic

NCT02228278 (Continued)

Interventions	Intervention: typical clinic visits plus text messages: daily texts for 12 weeks, with fitness and nutrition messages to support their health goals Comparator: current standard care: clinic visits every 3 months with anthropometric assessments and counselling on physical activity and nutrition goals by a healthcare provider, typically with no patient-provider communication between visits
Outcomes	Primary outcomes : feasibility and acceptability of text message intervention Secondary outcomes : changes from baseline proportion of healthy food choices versus unhealthy choices; changes from baseline time spent doing physical activity; changes from baseline BMI z score Other outcome : -
Starting date	Study start date: April 2015 Study completion date: February 2016
Contact information	Responsible party/principal investigator: University of Florida/Lindsay Thompson, MD
Study identifier	NCT02228278
Official title	Text 4 Fit Project: healthcare text messaging as an adjunct to routine care for overweight and obese adolescents enrolled in a pediatric lipid clinic
Stated purpose of study	Quote: "to determine if health-related text messages sent from healthcare providers to overweight and obese adolescents enrolled at a paediatric lipid clinic will result in increased adherence to their nutrition and physical activity goals and improve their weight loss. The study will also assess if the volume of texts per week impacts outcomes."
Notes	Trial status completed (according to trial record, accessed 18 August 2016). Contacted author (2 September 2016) for expected publication date, author response: currently drafting a manuscript

NCT02280772

Trial name or title	Acronym: -
Methods	Type of study: efficacy study Allocation: randomised Intervention model: parallel Masking: double blind (participant, carer, investigator, outcomes assessor) Primary purpose: treatment
Participants	 Condition: overweight and obesity Enrollment: 96 Inclusion criteria: aged 6-17 years; overweight (> +1 SD) or obesity (> +2 SD) based on the WHO growth charts/references Exclusion criteria: drug therapy for a chronic disease (including drugs that influence appetite or body weight); type 1 or 2 diabetes mellitus; history of surgical treatment of obesity; participation in another programme for treating obesity during the project or 3 months prior to recruitment, or both; secondary causes of obesity; pregnancy

	may impact quality of life
Interventions	Intervention: culturally grounded intensive behaviour changing intervention guided by social cognitive theory over 6 months Comparator: usual care control
Outcomes	Primary outcome: Secondary outcomes: improvements in glucose tolerance; reductions in 2-hour glucose following an oral glucose tolerance test Other outcomes: quality of life; body composition; decrease in fat mass and increase in lean tissue mass by dual-energy X-ray absorptiometry
Starting date	Study start date: January 2016 Study completion date: December 2021
Contact information	Responsible party/principal investigator: Arizona State University
Study identifier	NCT02615353
Official title	Preventing diabetes in Latino youth
Stated purpose of study	Quote: "To date, no diabetes prevention studies have been conducted in obese Latino youth with predi- abetes, a highly vulnerable and underserved group. Therefore, investigators propose a randomized-con- trolled trial to test the short-term (6-month) and long-term (12-month) efficacy of a culturally-grounded, lifestyle intervention, as compared to usual care, for improving glucose tolerance and reducing diabetes risk in 120 obese Latino adolescents with prediabetes."
Notes	Last updated: 17 April 2016

NCT02687516

Trial name or title	Acronym: FABO
Methods	Type of study: interventional Allocation: randomised Intervention model: cross-over assignment Masking: open label Primary purpose: treatment
Participants	Condition: - Enrollment: 120 Inclusion criteria: families of children aged 8-16 years attending an outpatient's obesity clinic; $BMI \ge 35$ kg/m ² or $BMI \ge 30$ kg/m ² with obesity-related comorbidity; both the child and at least 1 of the parents agrees to actively participate in the treatment Exclusion criteria: severe somatic or psychiatric illness that makes adherence to the treatment programme impossible; somatic conditions, syndromes or medications that lead to pathological weight gain; participation in other obesity treatment programmes

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 189 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

NCT02687516 (Continued)

Interventions	Intervention: 17 weekly manualised sessions with subsequent follow-up every 3 month for 2 years Comparator: treatment as usual, default treatment at the obesity clinic
Outcomes	Primary outcomes: BMI; waist circumference; body composition Secondary outcomes: blood samples; blood pressure; activity level/inactivity; sleep pattern; psychological measures; food records Other outcomes: parenting scale; barriers to treatment participation scale; treatment acceptability
Starting date	Study start date: February 2014 Study completion date: December 2018
Contact information	Responsible party/principal investigator: Petur B Juliusson, MD/PhD, University of Bergen
Study identifier	NCT02687516
Official title	Treatment of severely obese children and adolescents in common health care settings: an effectiveness study employing "Family-based Behavioral Social Facilitation Treatment."
Stated purpose of study	Quote: "The purpose of the FABO study is to evaluate the effect of family-based behavioral weight loss treatment (FBBT) compared with the effect of today's standard treatment given to children and adolescents suffering from obesity at the Obesity Outpatient Clinic (OOC), Haukeland University Hospital."
Notes	Last updated: 19 February 2016

NCT02711488

Trial name or title	Acronym: PAAPAS-DC
Methods	Type of study: efficacy study Allocation: randomised Intervention model: parallel assignment Masking: single blind (outcome assessor) Primary purpose: primary and secondary prevention (secondary prevention programme relevant here)
Participants	Condition: obesity Enrollment: 3000 Inclusion criteria: both prevention programmes: 5th and 6th grades students; consent form signed by parents/tutors; secondary prevention programme: overweight and obese children Exclusion criteria: pregnancy
Interventions	Intervention : encouraging students to change their eating habits and food consumption over 9 months (from March to November). Monthly 1-hour sessions in the classroom will be given by the class teacher, and includes playing games, staging theatre sketches, watching movies and puppet shows, and writing and drawing contests. Activities designed to discourage students from consuming sugar-sweetened beverages as well as getting them to replace snacks, particularly processed foods (especially cookies) with fresh fruit or healthy homemade food. To reinforce the messages of the in-class nutritional sessions, a set of messages will be sent to the families in the form of illustrated booklets and recipes. The secondary prevention strategy at

Study identifier	NTR5676
Official title	The focus on strength programme: an innovative strength-based physical activity intervention to improve body composition and to stimulate physical activity in adolescents (12-18 years) with overweight or obesity
Stated purpose of study	Quote: "a one year combined strength- and motivational program for high schools improve body compo- sition and motivation in overweight and obese youngsters."
Notes	Status: open, patient inclusion (date registered 8 February 2016)

Ramalho 2016

Trial name or title	Acronym: -
Methods	Type of study: effectiveness and cost-effectiveness trial Allocation: randomised Intervention model: parallel assignment Masking: - Primary purpose: treatment
Participants	Condition: obesity Enrollment: 120 Inclusion criteria: aged 13-18 years; $BMI \ge 25 \text{ kg/m}^2$ Exclusion criteria: -
Interventions	Intervention: Internet-based programme intervention + treatment as usual. Programme based on cognitive behavioural therapy. 9-month, 2-phase programme for weight loss and maintenance. Phase 1: weight loss through weight control, healthy eating and life-style strategies. Phase 2: weight maintenance through weight maintenance skills Comparator: treatment as usual
Outcomes	Outcomes: weight; eating related variables; physical activity; costs Primary outcome: unclear Secondary outcome: unclear Other outcomes: disorder eating behaviour; intuitive eating; physical activity; body image; impulsivity
Starting date	Study start date: Study completion date:

Official title	Taking the route back: new technologies for overweight and obesity treatment in childhood and adolescence - study protocol

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 194 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Ramalho 2016 (Continued)

Stated purpose of study	Quote: "a randomized controlled trial to examine the effectiveness and cost-effectiveness of an internet- based program intervention as supplementary tool for weight loss treatment in overweight and obese adolescents."
Notes	Contacted author (16 January 2017) for results/anticipated publication date

RBR-38p23s

Trial name or title	Acronym: -
Methods	Type of study: interventional Allocation: randomised Intervention model: parallel (3 arms) Masking: open label Primary purpose: treatment
Participants	Condition: obesity Enrollment: target 39 Inclusion criteria: aged 10-19 years; willingness to participate in all programme activities BMI for age and gender > 95th percentile (CDC 2000) Exclusion criteria: psychological disorders; use of medications that could interfere in the variables; physical difficulties that impeded the development of all activities
Interventions	Interventions: Complex intervention: 20 meetings with the adolescents (16 psychological intervention twice per week, 4 monthly nutritional orientations). 36 sessions of physical exercises 3 times per week. 9 meetings with parents that include nutritional meetings and physical education Simple intervention: 4 monthly meetings with adolescents for nutritional orientation and 36 sessions of physical exercises. 9 meetings with the parents with a psychologist, nutritionist and a physical educator Comparator: meetings with a nutritionist and a physical educator for the adolescents and parents and physical exercises sessions for adolescents
Outcomes	Primary outcomes : BMI, social competence, behavioural change, academic performance Secondary outcomes : intrinsic motivation and health-related outcomes. Other outcome :
Starting date	Study start date: March 2010 Study completion date: March 2011
Contact information	Responsible party/principal investigator: University Federal de São Paulo, Brazil/Graziela Sapienza
Study identifier	RBR-38p23s
Official title	Multifocal intervention in obese adolescents: social competence, behavior problems, academic performance and weight reduction
Stated purpose of study

Spieker 2015

Trial name or title	Acronym: POMC
Methods	Type of study: efficacy Allocation: randomised Intervention model: parallel assignment Masking: single blind (assessors at baseline) Primary purpose: prevention
Participants	 Condition: obesity and overweight Enrollment: 48 Inclusion criteria: female military dependents; aged 12-17 years; at high risk for excess weight gain (BMI ≥ 85th percentile) who report lifetime loss of control eating or ≥ 2 current indicators of loss of control eating (e.g. eating in response to negative affect, feelings of guilt or shame around eating) Exclusion criteria: presence of a chronic major medical illness (e.g. renal, hepatic, gastrointestinal, endocrinological); documented, obesity-related medical complication requiring a more intensive intervention approach; psychiatric conditions (e.g. psychosis, suicidality) that would impede programme participation; current weight loss treatment; current weight-affecting medication usage; pregnancy (current or recent); current breastfeeding
Interventions	 Intervention:interpersonal psychotherapy-based intervention: 1 initial 1.5-hour individual session, and 12 weekly 90-minute group sessions that take place after school hours. The interpersonal inventory interview to identify the strengths, problems and goals of the adolescent. Information used to link problems to loss of control eating and other disturbed eating attitudes or behaviours. Sessions delivered over different phases. A psychoeducation phase (sessions 1-3), such as education about the predictors of excess weight gain, outlining problem areas and discussing the link between feelings and interpersonal interactions. Intermediate phase (sessions 4-9) where group members practice skills such as hypothetical scenarios and role-plays. Training on how interpersonal strategies can be applied to different, specific relationships in the adolescents' lives, particularly relationships that are linked to loss of control eating and related symptoms, with a focus on identifying possible warning signs of a return or increase in problematic eating and knowing when to seek help. Finally, group members are encouraged to continue the interpersonal work on their own Comparator:health education control: receives a workbook on how to live a healthier life, discussing topics unrelated to eating. Participants complete 4 monthly 90-minute group meetings during after school hours to discuss the information presented in the workbook. The workbook will serve as a guide for teens to improve their self-image, build friendships, resist peer pressure and engage in goal-setting
Outcomes	 Primary outcomes: % participants who do not gain weight during follow-up; total weight change as markers of outcomes Secondary outcome: not clearly stated Other outcomes: eating disorder examination; Schedule for Affective Disorders and Schizophrenia for School-Age Children; Social Adjustment Scale - Self-Report; Family Adaptation and Cohesion, Evaluation Scales Inventory; Beck Depression Inventory State-Trait Anxiety Inventory for Children - a trait scale; Life Events and Coping Inventory; Eating Disorder Diagnostic Scale; Treatment Acceptability Questionnaire;

Official title	Preventing Obesity in the Military Community (POMC): the development of a clinical trials research network
Stated purpose of study	Quote: "IPT will decrease loss of control eating and reduce these adverse outcomes. A secondary hypothesis of this study is that girls in the IPT group who maintain their weight or experience weight loss will demonstrate an improvement in components of the metabolic syndrome at follow-up visits."
Notes	Quote: "We use percentage of participants who do not gain weight during follow-up and total weight change as markers of our study outcomes We hypothesize that POMC [Preventing Obesity in Military Communities] intervention programs will reduce weight gain beyond the control comparison programs in the period following study participation."

^aAccording to power calculation in study publication or report.

^bDuration of follow-up/(duration of intervention).

 c For number of participants finishing the study the publication stated that 26 participants in the normocaloric diet + physical activity group and 25 participants in the no intervention groups finished the study but also reported that there were four dropouts/withdrawals in the normocaloric diet + physical activity group and eight dropouts/withdrawals in the no intervention group.

^{*d*}At 6 months, only 115 (46%) children in the multicomponent intervention group and 135 (54%) children in the standard care group participated in a follow-up examination.

^eNumbers did not add up accurately because of missing data per intervention/comparator groups in some trials.

C: comparator; CBT: cognitive behavioural therapy; FBT-PO: family-based therapy for paediatric overweight; GI: glycaemic index; GL: glycaemic load; I; intervention; ITT: intention to treat; n: number of participants; N/A: not applicable; RCT: randomised controlled trial; SMS: short message service.

Study	Tool	Outcome	Findings
Norman 2016	Child's BMI - median BMI for age and gender)/median BMI for age and gender × 100	% over median BMI	At 12 months, a significant treat- ment effect was observed in boys in the stepped care group compared to the enhanced usual care group (P = 0.002)
Schranz 2014	Scales	Body mass (kg), mean ± SD	At 12 months, there was no signif- icant difference (P= 0.69) between the intervention (99.3 \pm 16.6; 30 participants) and control group (104 \pm 27.1; 26 participants)
	Calliper	Sum of skinfolds (mm), mean ± SD	At 12 months, there was no sig- nificant difference (P= 0.86) be- tween the intervention (249.4 \pm 72. 9; 30 participants) and control group (248.1 \pm 96.9; 26 participants)

Table 2. Anthropometric data

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 273 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Carraway 2014	By comparing actual BMI to BMI at the 50th percentile	% overweight)	Participants in both groups were able to reduce % overweight from base- line to post-test by 1.98% and from baseline to follow-up by 1.48%
	DXA	% fat	Reduction from baseline to postin- tervention tended towards signifi- cance. However, this reduction was reversed across follow-up
Pakpour 2015	Bioelectrical impedance analysis	% fat, mean ± SD	At 12 months, the motivational interview + parental involvement group had significantly (P = 0.001) lower body fat ($42.32 \pm 3.56\%$; 118 participants) compared to the con- trol ($45.33 \pm 4.86\%$; 115 partici- pants) but was not superior (P= 0. 38) to the motivational interviewing group ($45.62 \pm 4.32\%$; 113 partici- pants)
Kong 2014	Bioimpedence	% visceral fat, median (interquartile range)	At 6 months, no significant reduc- tion of visceral fat in either the low GI group (from 14.2 (10.8 to 19.8) to 12.0 (10.0 to 19.0); 27 partici- pants) or the control group (from 12. 5 (9.0 to 19.0) to 13.5 (7.5 to 20.5) ; 34 participants)
Brennan 2013	Body scan	Trunk lean mass (kg), mean ± SD	At 6 months, the intervention group had lower truncal lean mass (21.67 \pm 4.72; 42 participants) compared to the control group (21.99 \pm 3.96; 20 participants)
Toulabi 2012	Anthropometric tape	Hip circumference (cm), mean ± SD	At 6 months, the intervention group had a significantly lower (P = 0.001) circumference (105.18 \pm 7.38; 76 participants) compared to the con- trol (109.80 \pm 6; 76 participants)
Vos 2011	Anthropometric tape	Waist circumference-SDS, MD, 95% CI	At 12 months, the mean change in the intervention group (-0.6, -1.2 to -0.00; 32 participants) was signifi- cantly lower (P = 0.03) compared to the control group (-0.2, -0.7 to 0.5; 34 participants)

Table 2. Anthropometric data (Continued)

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 274 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

	Stadiometer and anthropometric tape	Waist circumference/height, MD, 95% CI	At 12 months, the mean change in the intervention group (-0.03, -0.06 to 0.00; 32 participants) was signifi- cantly lower (P = 0.03) compared to the control group (-0.01, -0.03 to 0. 00; 34 participant)
Ford 2010	Bioimpedence	% body fat-SDS, MD, 95% CI	At 12 months, the Mandometer group had a greater fall in body fat (- 0.32, 0.22 to 0.41; 43 participants) compared to the control group (-0. 07, -0.04 to 0.18; 45 participants)
Chandra 1968	Beam balance	Average weight loss (% of expected)	At 17 months, the difference be- tween the intervention group (Lim- ical) and the control tended to level off (112% in the intervention in comparison to 114% in the control)

BMI: body mass index; CI: confidence interval; DXA: dual-energy X-ray absorptiometry; GI: glycaemic index; kg: kilogram; MD: mean difference; mm; millimetre; SD: standard deviation; SDS: standard deviation score.

Table 3.	Behavioural ch	ange - health-related	quality of life	e and self-esteem

Study	Tool	Outcome	Findings
Hofsteenge 2014 Body Esteem Scale	Body Esteem Scale	Body appearance, mean ± SD	At 18 months, body appearance scores did not significantly im- prove in either the intervention (from 1.8 ± 0.7 to 2.2 ± 0.7 ; 57 participants) or the control group (from 1.9 ± 0.8 to 0.3 ± 0.75 ; 38 participants)
		Weight satisfaction, mean ± SD	At 18 months, weight satisfac- tion scores did not significantly improve in either the interven- tion (from 1.6 \pm 0.7 to 1.7 \pm 0. 7; 57 participants) or the con- trol group (from 1.7 \pm 0.6 to 1. 8 \pm 0.7; 38 participants)
		Body attribution, mean ± SD	At 18 months, body attribution scores did not significantly im- prove in either the intervention (from 1.8 ± 0.8 to 2.3 ± 0.8; 57 participants) or the control

			group (from 1.9 ± 1.0 to 2.0 ± 0.6; 38 participants)
Schranz 2014	Physical self-worth scale	Global physical self-worth, mean ± SD	At 12 months, there was no sig- nificant difference (P= 0.52) for physical self-worth between the intervention (2.40 \pm 0.54; 30 participant) and control group (2.44 \pm 0.57; 26 participants)
Carraway 2014	40-item Children and Youth Physical Self-Perception Profile measure	Global self-esteem	At 7 months, significant change in global self-esteem by time for both groups
Pakpour 2015	20-item weight efficacy lifestyle questionnaire	Weight efficacy, mean ± SD	At 12 months, the motivational interview + parental involve- ment had significantly higher confidence scores for their abil- ity to lose weight (108.05 \pm 24.28; 118 participants) com- pared to the control (93.21 \pm 29. 60; 115 participants; P = 0.002) and the motivational interview group (101.27 \pm 27.23; 113 par- ticipants; P = 0.04)
Ford 2010	Paediatric quality of life inven- tory	Health-related quality of life	Measures of quality of life im- proved in both the Mandometer and control group with no sig- nificant change at 12 months
van Egmond-Frohlich 2006	KINDL-K (self- report) and KINDL-E (parents) , 24 items with subscales fam- ily, friends, school, self-worth, mental and physical well-being (4 items per domain)	Health-related quality of life	At 12 months, (total group) statistically significant improve- ments in obesity-related qual- ity of life and subdomains fam- ily, friends, school, physical and mental well-being

KINDL: Fragebogen für KINDer und Jugendliche zur Erfassung der gesundheitsbezogenen Lebensqualität (questionnaire for children and adolescents to record health-related quality of life); SD: standard deviation.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 276 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Table 4. Behavioural change - dietary intake

Study	Tool	Outcome	Findings
Pbert 2013	24-hour dietary recall	Fat (% of energy), MD, 95% CI	At 6 months, no significant change in the intervention arm (1.21, -1. 99 to 4.41;2 participants) and the control arm (MD 1.19, 95% CI -1.92 to 4.30; 40 participants) for fat intake
Ebbeling 2003	7-day food record	Fat (% of energy), mean ± SD	At 12 months, a significant decrease (P= 0.03) in the conven- tional reduced fat arm (from 33 ± 1 to 29 ± 3 ; 7 participants) but tended to increase in the glycaemic load arm (27 ± 2 to 29 ± 3 ; 7 par- ticipants)
Saelens 2002	2-day dietary recall	Fat (% of energy), mean ± SD	At 7 months, no significant change in the Healthy Habits intervention arm (from 33.9 ± 8.8 to 32.9 ± 9 . 4; 18 participants) and the typical care arm (from 34.3 ± 4.9 to 35.6 ± 6.4 ; 18 participants)
Kong 2014	3-day dietary record	Protein (% of energy), mean ± SD	At 6 months, the low GI group had a significantly (P = 0.002) higher protein intake (17.9 ± 3.8; 34 par- ticipants) compared to the control (15.9 ± 2.7; 27 participants)
Ebbeling 2003	7-day food record	Protein (% of energy), mean ± SD	At 12 months, there was no signif- icant change in protein intake in the glycaemic load arm (from 17 \pm 2 to 20 \pm 1; 7 participants) or the conventional reduced fat group (from 16 \pm 1 to 18 \pm 2; 7 partici- pants)
Kong 2014	3-day diet record	Carbohydrate (% of energy), mean ± SD	At 6 months, there was no signif- icant difference for carbohydrate mean intake between the low GI group (50.8 \pm 8.1; 34 participants) and the control group (49.5 \pm 6.6; 27 participants)
Ebbeling 2003	7-day food record	Carbohydrate (% of energy), mean ± SD	At 12 months, there was a non-sig- nificant decrease (P = 0.07) in the reduced glycaemic load arm (from

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 277 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

			58 ± 3 , to 52 ± 4 ; 7 participants) and no significant change in the conventional reduced fat arm
Kong 2014	3-day diet record	Glycaemic load (per 100 kcal), mean ± SD	At 6 months, there was no signifi- cant (P = 0.175) difference for gly- caemic load mean intake between the low GI group (117.7 \pm 42.5; 34 participants) and the control group (106.3 \pm 42.7; 27 participants)
Pbert 2013	24-hour dietary recall	Glycaemic load, MD, 95% CI	At 6 months, the was a reduction in the intervention arm (-22.93, -39. 68 to -6.18) but not in the control arm (-11.08, -27.36 to 5.20)
Ebbeling 2003	7-day food record	Glycaemic load (g/100 kcal), mean ± SD	At 12 months, there was a signif- icant (P = 0.007) decrease in the reduced glycaemic load arm (from 86 ± 5 to 69 ± 6 ; 7 participants) but not in the conventional reduced fat arm (from 79 ± 2 to 79 ± 7; 7 par- ticipants)
Visuthranukul 2015	3-day dietary record	Low glycaemic index diet (items/ day), MD ± SD	At 6 months, the consumption of low glycaemic food items increased in the intervention group $(3.6 \pm 1.$ 6; 25 participants) while the con- trol group consumed fewer items $(-0.4 \pm 1.5; 27 \text{ participants})$
Kong 2014	3-day dietary record	Glycaemic index, mean ± SD	At 6 months, there was no signifi- cant (P = 0.175) difference for gly- caemic index mean intake between the low GI group (74.4 \pm 8.7; 34 participants) and the control group (76.8 \pm 10.2; 27 participants)
Ebbeling 2003	7-day food record	Glycaemic index, mean ± SD	At 12 months, there was no signif- icant reduction in the reduced gly- caemic load arm (from 58 ± 2 to 53 ± 3 ; 7 participants) or the conven- tional reduced fat arm (from 59 ± 1 to 56 ± 2 ; 7 participants)
Pbert 2013	24-hour dietary recall	Total sugar (g/day), MD, 95% CI	At 6 months, total sugar intake re- duced in the intervention arm (- 29.15, -49.08 to -9.22) but not in the control arm (-11.37, -30.71 to

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 278 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

			7.96)
Ebbeling 2012	24-hour dietary recall (3 recalls)	Sugar (g/day), MD ± SD	At 2 years, the intervention group consumed less sugar compared to the control (-19 \pm 7, P = 0.005; 209 participants)
Kong 2014	3-day dietary record	Fibre (g/1000 kcal), mean ± SD	At 6 months, the low GI group had a higher (P = 0.041) fibre intake (6. 5 ± 3.3 ; 34 participants) compared to the control arm (5.3 \pm 2.5; 27 participants)
Ebbeling 2003	7-day food record	Fibre (g/1000 kcal), mean ± SD	At 12 months, fibre intake did not increase significantly in the re- duced glycaemic load arm (from 8 \pm 1 to 10 \pm 1; 7 participants) or the conventional reduced fat arm (from 8 \pm 1 to 10 \pm 2; 7 partici- pants)
Pakpour 2015	FFQ	Fruits and juice (servings/day), mean ± SD	At 12 months, the motivational interview + parental involvement group had a higher (P = 0.030) intake of fruit servings (1.33 \pm 0. 93; 118 participants) compared to the control group (1.23 \pm 0.97; 115 participants), but did not sig- nificantly (P = 0.17) differ com- pared to the motivational inter- view group (1.31 \pm 0.96; 113 par- ticipants)
Patrick 2013	FFQ	Fruit and vegetable (servings per 1000 calories), mean ± SE	At 12 months, fruit and vegetable consumption did not change the web-only group (from 1.9 ± 0.01 to 2.9 ± 0.01 ; P= 0.685; 26 partici- pants), web + sessions group (from 2.3 ± 0.01 to 2.9 ± 0.01 ; P = 0.398; 26 participants) and web + SMS group (from 2.0 ± 0.01 to $2.6 \pm$ 0.01; P = 0.369; 24 participants) compared to the usual care group (from 1.9 ± 0.01 to 2.0 ± 0.01 ; 25 participants)
Kong 2013	FFQ	Fruits and vegetables (servings/ day), median, 95% CI	At 6 months, there was no change in the intervention arm (-0.22, - 0.72 to 0.41; 28 participants) or

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 279 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

			the control arm (-1.16, -0.56 to 0. 02; 23 participants) for fruit and vegetables intake
Wengle 2011	4-day record	Fruits and vegetables (serving/day) , mean ± SD	At 6 months, fruits and vegeta- bles consumption did not signifi- cantly increase in either the non- mentored group (from 1.9 ± 1.5 to 1.8 ± 1.7 ; P = 0.79; 14 participants) or the mentored group (from 2.9 \pm 2.7 to 2 \pm 2; P = 0.63; 14 partic- ipants)
Pakpour 2015	FFQ	Vegetables (servings/day) mean ± SD	At 12 months, there was no sig- nificant difference for vegetable consumption across the motiva- tional interview + parental involve- ment group $(1.77 \pm 0.76; 118 \text{ par-ticipants})$, motivational interview group $(1.71 \pm 0.80; 113 \text{ partici-pants})$, and the control group $(1.$ $64 \pm 0.80; 115 \text{ participants})$
Brennan 2013	Dietary questions from the YBRS	Vegetables (serving/day), mean ± SD	At 6 months, there was no differ- ence (P = 0.901) for vegetables in- take between the intervention (2. 98 ± 1.13 ; 41 participants) and the control group (3.00 ± 0.71; 21 par- ticipants)
Brennan 2013	Dietary questions from the YBRS	Juice (serving/day), mean ± SD	At 6 months, there was no dif- ference (P = 0.056) for juice con- sumption between the interven- tion (2.07 \pm 1.18; 40 participants) and control group (2.71 \pm 1.31; 21 participants)
Ebbeling 2012	24-hour dietary recall (3 recalls)	Fruit juices beverages (serving/day) , MD ± SD	At 2 years, there was no difference in the reduction of fruit juice con- sumption between the interven- tion and control group (-3 \pm 17; P = 0.44; 209 participants)
Pakpour 2015	FFQ	Milk (servings/day), mean ± SD	At 12 months, there was no sig- nificant difference for milk intake across the motivational interview + parental involvement group (0.96 \pm 0.43; 118 participants), motiva- tional group (0.95 \pm 0.29; 113 par-

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 280 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

			ticipants) and the control group (0. 97 ± 0.37; 115 participants)
Brennan 2013	Dietary questions from the YBRS	Milk (serving/day), mean ± SD	At 6 months, there was no differ- ence (P = 0.99) for milk consump- tion between the intervention (3. 63 ± 1.61 ; 41 participants) and the control group (3.59 ± 1.56; 21 par- ticipants)
Pakpour 2015	FFQ	Non-diet soda (servings/day), mean ± SD	At 12 months, the motivational interview + parental involvement group consumed fewer sugary drinks (0.48 \pm 0.35; 118 participants) compared to the control group (0.95 \pm 0.33; P = 0.001; 115 participants) and the motivational interview group (0.77 \pm 0.38; P = 0.01; 113 participants)
Kong 2013	FFQ	Sweetened drinks (glasses/day), median, 95% CI	At 6 months, there was a signifi- cant reduction in sweetened drinks consumption in the intervention arm (-0.12, -0.47 to -0.08; 28 par- ticipants) compared to the control arm (-0.16, -0.57 to 0.22; 23 par- ticipants)
Ebbeling 2012	24-hour dietary recall (3 recalls)	Sugar-sweetened beverages (serv- ing/day), MD ± SD	At 2 years, the intervention group consumed fewer sugar-sweetened beverages compared to the control group (-58 ± 21; P = 0.007; 209 participants)
Pakpour 2015	FFQ	Snacks/desserts (servings/day), mean ± SD	At 12 months, the motivational interview + parental involvement group consumed fewer snacks (3. 89 ± 1.65 ; 118 participants) com- pared to the control group (4.55 \pm 1.71; P < 0.001; 115 partici- pants) and the motivational inter- view group (4.12 \pm 1.43; P = 0.04; 113 participants)
Wengle 2011	4-day dietary record	Total snack food (servings/week), mean ± SD	At 6 months, the non-mentored group had a non-significant de- crease (P = 0.06) in snacks con- sumption (from 10.3 ± 6.9 to $6.3 \pm$ 4.2; 14 participants). Similarly, the

Table 4.	Behavioural	change - dietar	y intake	(Continued)
----------	-------------	-----------------	----------	-------------

			mentored group had a non-signifi- cant (P = 0.07) reduction in snacks consumption (from 8.9 ± 3.3 to 7. 4 ± 3.8 ; 14 participants)
Pakpour 2015	FFQ	Total dietary fat (g), mean ± SD	At 12 months, the motivational interview + parental involvement group had a lower (P = 0.012) fat consumption (74.40 ± 42.39; 118 participants) compared to the con- trol group (95.73 ± 40.10; 115 par- ticipants). There was a reduction (P = 0.041) when comparing the motivational interview + parental involvement group to the motiva- tional interview group (98.42 ± 49. 83; 113 participants)
		Saturated fat (g), mean ± SD	At 12 months, the control group had a lower (P < 0.001) con- sumption of saturated fat (30.03 \pm 20.84; 115 participants) com- pared to the motivational inter- view + parental involvement group (35.52 \pm 21.48; 118 participants) . Similarly, the motivational inter- view group had a lower consump- tion (32.54 \pm 22.86; P = 0.029; 113 participants) compared to the motivational interview + parental involvement group
		Fried foods (servings/day), mean ± SD	At 12 months, the motivational interview + parental involvement group consumed fewer (P= 0.01) servings of fried foods (0.63 ± 0.33 ; 118 participants) compared to the control group (0.90 ± 0.44 ; 115 participants). Similarly, the moti- vational interview + parental in- volvement group consumed fewer fried foods compared to the moti- vational group (0.82 ± 0.30 , P = 0. 042; 113 participants)
Pbert 2013	24-hour dietary recall	% calories saturated fat, MD, 95% CI	At 6 months, there was no change % calories of saturated fat in the intervention arm (1.21, -1.99 to 4. 41) or the control arm (1.19, 95%

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 282 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

			CI -1.92 to 4.30)
		Added sugar (g/day), MD, 95% CI	At 6 months, sugar intake reduced in the intervention arm (-18.87, - 40.17 to 2.43) but not in the con- trol arm (-7.20, -27.59 to 13.19)
Brennan 2013	Brennan 2013 Dietary questions from the YBRS	Fruit (serving/day), mean ± SD	At 6 months, there was no differ- ence (P = 0.518) between the in- tervention (3.49 ± 0.32 ; 39 partic- ipants) and the control group (3. 48 ± 1.17 ; 21 participants) for fruit consumption
		Potatoes (serving/day), mean ± SD	At 6 months, there was no dif- ference (P = 0.141) for potatoes intake between the intervention group (2.25 \pm 0.78; 40 partici- pants) and the control group (2.67 \pm 0.86; 21 participants)
		Carrots (serving/day), mean ± SD	At 6 months, there was no signifi- cant difference (P = 0.948) for car- rots intake between the interven- tion group (2.15 \pm 0.52; 41 partic- ipants) and the control group (2. 38 \pm 0.92; 21 participants)
		Salad (serving/day), mean ± SD	At 6 months, there was no differ- ence (P = 0.515) for salad con- sumption between the interven- tion group (2.38 \pm 1.21; 40 partic- ipants) and the control group (2. 57 \pm 1.50; 21 participants)
Ebbeling 2012	24-hour dietary recall (3 recalls)	Artificially sweetened beverages (servings/day), MD ± SD	At 2 years, there was no difference in the consumption of artificially sweetened beverages between the intervention and control group (0. 1 ± 0.1 , P = 0.32; 209 participants)
		Unsweetened beverages (servings/ day), MD ± SD	At 2 years, the consumption of unsweetened beverages remained higher in the intervention group compared to the control group (0.6 \pm 0.2, P < 0.001; 224 participants)

Open communication provides an indication of the freedom of expres- sion, understanding and satisfaction during family communications with high scores indicating positive com- munication	Open communication	At 6 months, intervention group had signif- icantly increased scores compared to control group
	Parent Adolescent Communication Scale designed to assess communica- tion between parent and adolescents. Problem communication focuses on negative interaction styles and con- straints in communication with high scores indicating negative communi- cation	Problems in communication	At 6 months, there was no difference be- tween the intervention group and the con- trol group
	The Family Problem Solving Com- munication Index to measure prob- lem solving and coping during fam- ily interactions. Incendiary indicates high levels of problematic commu- nication that inflame a difficult in- teraction with high scores indicating high levels of problematic communi- cation	Incendiary communication	At 6 months, there was no difference be- tween the intervention group and control group
	The Family Problem Solving Com- munication Index to measure prob- lem solving and coping during fam- ily interactions. Affirming commu- nication indicates high levels of sup- portive communication styles that calm a difficult interaction with high scores indicating supportive commu- nication	Affirming communication	At 6 months, there was no difference be- tween the intervention group and control group

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 293 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Appendix 2. Description of interventions

Trial ID	Interventions	Comparators
Patsopoulou 2017	I1: activity programme 3-day per week training programme (45 minutes per training session) for 12 weeks. Instructed to add an extra 30-45 min- utes of walking or other sport activity of their preference at least once per week and to reduce inactivity	No intervention
	I2: as for activity group + nutritional education introductory meeting (45-60 minutes). Parents were invited to attend sessions	

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 303 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Jelalian 2016	CBT for depression and healthy lifestyle plus ex- ercise: CBT treatment adapted into 1 integrated protocol that addresses depression, an exercise component, weight and advice regarding healthy eating. Weekly 60-minute group aerobic exercise sessions were required and facilitated by a phys- iotherapist	CBT for depression treatment only
Norman 2016		Enhanced usual care. 1 counselling visit, 1 health education visit, materials and monthly mailings of weight-related materials
Hofsteenge 2014	Group education on dietary behaviour, physical activity and energy balance	Referral to a dietitian
Schranz 2014	Resistance training	No intervention
Visuthranukul 2015	Low GI diet. Monthly visits for 6 months. Each visit consisted of a 2-hour, small class teaching session with parental participation (4-5 families per class)	Conventional diet. Monthly visits for 6 months (1 per month for 6 months)
Wong 2015	Monthly dietary counselling with a registered di- etitian and daily text messaging	Monthly dietary counselling with a registered di- etitian and daily text messaging
Pakpour 2015	I1: MI. Physical activity and dietary intervention, 40-minute session weekly for 6 weeks	Passive control: no details
	I2: MI + parental involvement. As for MI group with 1-hour parental session after 6 weeks	
Bean 2014	I1: MI values. 2 sessions, values clarification, re- examined value/behaviour congruency and ideas for change + TEENS family-based intervention	Education control. Watched 2 educational videos, week 1 and week 10 + TEENS family-based intervention
Carraway 2014	12-week mentor-led exercise programme. Each adolescent paired with a college student mentor who was majoring in exercise physiology or re- lated field. Mentor/mentee pairs met for 3 exer- cise sessions per week, each lasting 1 hour. Activ- ity type varied by session and was decided collab- oratively and included exercise machines (tread-	Wait list control

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 304 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

	mill, stationary bike, elliptical), racquetball, ten- nis, group outdoor activities (flag football, tag) . Mentees wore heart rate monitors to monitor exercise intensity. In addition to exercise, the 12- week programme included individual weekly cog- nitive behavioural-based challenges, or lessons. Mentors received 12 hours of training in MI and behavioural strategies to increase physical activity and modify eating. Mentors also received weekly supervision on goal setting and related topics. Parents of adolescents attended monthly parent meetings to discuss progress and build support through education	
Sigal 2014	I1: diet + aerobic training, reduced calorie diet and 4 weekly visits to gym for aerobic training over 22 weeks	Diet only: reduced calorie diet and usual activity
	I2: diet + resistance training: reduced calorie diet and 4 weekly visits to gym for resistance training over 22 weeks	
	I3: diet + aerobic + resistance training: reduced calorie diet and 4 weekly visits to gym for aerobic and resistance training over 22 weeks	
Love-Osborne 2014	MI: diet and exercise goal setting, additional text messages for half the group	Control group, no details
Kong 2014	Low GI diet individual counselling diet, physical activity and behavioural components. 7 sessions over 6 months	Usual Chinese diet: individual counselling diet, physical activity and behavioural components. 7 sessions over 6 months
Luna-Pech 2014	Normocaloric diet and physical activity, seen ev- ery 2 weeks for 28 weeks	No intervention, free diet, seen every 2 weeks for 28 weeks
Boodai 2014	Group sessions focusing on reduction in seden- tary behaviour, diet, promotional of physical ac- tivity	No intervention, advice to attend primary care
Gourlan 2013	MI + standard weight loss. Behaviour modifica- tion as well as standard weight loss intervention. No details of number sessions	Standard weight loss: balanced diet, a healthy lifestyle and physical activity
Patrick 2013	I1: website intervention. To promote weight loss and healthy behaviours. 51-week intervention, website for adolescents and for parents	Usual care. Given printed materials

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 305 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

	I2: website + group. To promote weight loss and healthy behaviours. 51-week intervention, web- site for adolescents and for parents. Also group support sessions (number not stated)	
	I3: website + SMS. To promote weight loss and healthy behaviours. 51-week intervention, web- site for adolescents and for parents. Text messages sent weekly	
Kong 2013	ACTION. MI, visit to clinician every 2-3 weeks for a total of 8 visits over 1 academic year, DVD toolkit	Standard care. 1 clinician visit and printed infor- mation
Pbert 2013	"Lookin' Good Feelin' Good." 6 × 1-on-1 coun- selling sessions conducted over 2 months focused on behavioural change, diet and physical activity goals	6 × 1-on-1 visits with the school nurse, informa- tion pamphlets
Brennan 2013	MI. 13 sessions over 4-6 months with or without parent. Then maintenance phase of 2×1 -hour clinic sessions and 7×15 -minute maintenance telephone call session and a final face-to-face session 6 months after the last treatment session	Wait list control
Walpole 2013	MI: focus on unhealthy behaviours, 6 sessions, 30-minutes long	Social skills training: finding ways to navigate so- cial situations, 6 sessions, 30-minutes long
Toulabi 2012	Behavioural modification. Dietary modification and techniques for increasing physical activity. 8 \times 45-minute sessions, held twice per week and group physical activity 1 hour per day, 3 days per week, for 6 weeks	Educational booklets
Debar 2012	Multicomponent intervention. Group meetings, 16 times (90 minutes each) over 5 months for adolescents and 12 sessions for parents	Usual care. Clinic visit, information and resources
Ebbeling 2012	Multicomponent intervention. Emphasis on the consumption of sugar-sweetened beverages, pro- vided with written information, telephone calls and 3 check-in visits (20 minutes per visit). Monthly motivational telephone calls with par- ents (30 minutes per call)	Control: no details
Vos 2011	Family-based CBT + nutrition. Educational ses- sions, computer package, 7 children group meet- ings - 2.5 hours' duration biweekly. 5 parent meet- ings, 1 parent and child meeting	Wait list control

	were held separately for parents and children. At- tended twice per week for 6 months and then ev- ery other week for an additional 6 months			
van Egmond-Frohlich 2006	Multicomponent intervention: after a rehabilita- tion programme participating physicians of the intervention group received a practice guideline: this addressed the guilt or fate problem, treatment aims (health promotion activities), guidance on fat-limiting mixed diet, promotion of a physical active lifestyle, local support resources, promo- tion of flexible control of eating and patient guid- ance according to the public health counselling and self-management model The outpatient programme was intended to have health check-ups every 4 weeks during the first 12 months (10-12 appointments)	Standard care		
Daley 2005	Exercise counselling. 8 weekly behavioural ses- sions focused on attitudes to exercise. Offered aer- obic exercise modalities, asked to exercise inter- mittently for 30 minutes, 3 times per week for 8	C1: exercise placebo. 24 sessions over 8 weeks; performed light body-conditioning/stretching exercises C2: usual care		
Resnicow 2005	weeks Go Girls. High intensity. Weekly (20-26) be- havioural sessions. 1 meeting/week for 6 months (parents attending 10-13 times), 1 day retreat, 6 MI telephone calls. 2-way paging messages to sup- port behavioural change. Retreats (unclear how many)	Moderate intensity 6 sessions over 6 months (1 per month), parents attending 3. Sessions were selected from the larger pool of sessions delivered to the intervention group		
Jiang 2005	Family-based intervention. 104 weeks (2 years). Unclear number of sessions	Usual care		
Carrel 2005	Lifestyle-focused gym classes. Fitness-oriented group gym classes, movement time was 42 min- utes of a 45-minute class period. 36- week (9 month) intervention, 90 sessions	Standard gym classes. 36-week (9-month) inter- vention, 90 sessions (5 times every 2 weeks for a 45-minute class period), Movement time 25 min- utes of the 45-minute period		
Ebbeling 2003	Low GL diet. 12 sessions over 6 months (12 di- etary counselling sessions) and a 6-month follow- up (2 dietary counselling sessions)	Conventional low-fat diet. 12 sessions over 6- months (12 dietary counselling sessions) and a 6- month follow-up (2 dietary counselling sessions)		
Saelens 2002	Healthy Habits. Computer- and telephone-deliv- ered intervention, focus on diet and physical ac- tivity goals, 1 tailored physician-counselling ses- sion. 12 telephone call sessions with counsellor (10-20 minutes). Overall duration was 16 weeks with 13 sessions	Standard care. Non-tailored physician-coun- selling session

	5. Was an objective out- come used?	Yes	Unclear	No
	6. Were x 80% of par- ticipants enrolled in tri- als included in the anal- ysis (i.e. no potential re- porting bias)? ^e	Yes	No ()	Yes

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 401 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

	7. Were data reported consistently for the out- come of interest (i.e. no potential selective re- porting)?	Yes	No ()	No (some studies did not re- port health-related quality of life despite mentioning)
	8. No other biases reported (i.e. no potential of other bias)?	Yes	No ()	Yes
	9. Did the trials end up as scheduled (i.e. not stopped early)?	Yes	Yes	Yes
Inconsistency ^b	1. Point estimates did not vary widely?	No (some variability)	N/A	Yes
	2. To what extent did con- fidence intervals over- lap (substantial: all confi- dence intervals overlap at least one of the included studies point estimate; some: confidence inter- vals overlap but not all overlap at least one point estimate; no: at least one outlier: where the confi- dence interval of some of the studies do not over- lap with those of most in- cluded studies)?	Some	N/A	Some
	3. Was the direction of effect consistent?	Yes	N/A	Yes
	4. What was the mag- nitude of statistical het- erogeneity (as measured by I^2) - low ($I^2 < 40\%$), moderate ($I^2 40\%$ -60%) , high $I^2 > 60\%$)?	High ()	N/A	High ()
	5. Was the test for heterogeneity statistically significant (P < 0.1)?	Statistically significant ()	N/A	Statistically significant ()

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 402 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Indirectness ^a	1. Were the populations in included studies ap- plicable to the decision context?	Highly applicable	Applicable	Highly applicable
	2. Were the interven- tions in the included studies applicable to the decision context?	Highly applicable	Highly applicable	Highly applicable
	3. Was the included out- come not a surrogate outcome?	No () for BMI and BMI z score	Yes	Yes
	4. Was the outcome timeframe sufficient?	Sufficient	Sufficient	Sufficient
	5. Were the conclusions based on direct compar- isons?	Yes	Yes	Yes
Imprecision ^c	1. Was the confidence in- terval for the pooled esti- mate not consistent with benefit?	No	N/A	No
	2. What is the magni- tude of the median sam- ple size (high: 300 par- ticipants, interme- diate: 100-300 partici- pants, low: < 100 partic- ipants)? ^e	High	High	High
	 3. What was the magnitude of the number of included studies (large: > 10 studies, moderate: 5-10 studies, small: < 5 studies)?^e 	Large	Moderate	Moderate
	4. Was the outcome a common event (e.g. oc- curs more than 1/100)?	N/A	Unclear	N/A
Publication bias ^d	1. Was a comprehensive search conducted?	Yes	Yes	Yes
	2. Was grey literature searched?	Yes	Yes	Yes

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 403 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

3. Were no restrictions applied to study selec- tion on the basis of lan- guage?	Yes	Yes	Yes
4. There was no industry influence on studies in- cluded in the review?	Yes	Yes	Yes
5. There was no evidence of funnel plot asymme- try?	Unclear	N/A	Unclear
6. There was no dis- crepancy in findings be- tween published and un- published trials?	Unclear	Unclear	Unclear

 a Questions on risk of bias were answered in relation to the majority of the aggregated evidence in the meta-analysis rather than to individual studies.

 b Questions on inconsistency were primarily based on visual assessment of forest plots and the statistical quantification of heterogeneity based on I².

^cWhen judging the width of the confidence interval it was recommended to use a clinical decision threshold to assess whether the imprecision was clinically meaningful.

^dQuestions addressed comprehensiveness of the search strategy, industry influence, funnel plot asymmetry and discrepancies between published and unpublished trials.

^eDepended on the context of the systematic review area.

(): key item for potential downgrading the quality of the evidence (GRADE) as shown in the footnotes of the 'Summary of finding' table

BMI: body mass index; N/A: not applicable.

WHAT'S NEW

Last assessed as up-to-date: 14 July 2016.

Date	Event	Description
26 April 2017	New search has been performed	This is an update of the former Cochrane Review 'Interven- tions for treating obesity in children and adolescents.'
26 April 2017	New citation required and conclusions have changed	 Given the rapid growth in the treatment of child and adolescent obesity, we have split the original review ('Interventions for treating obesity in children and adolescents') into six separate reviews, with a specific intervention and age focus Diet, physical activity, and behavioural interventions for the treatment of overweight or obesity in adolescents aged 12 to 17 years Diet, physical activity, and behavioural interventions for the treatment of overweight or obese children from the age of 6 to 11 years Diet, physical activity, and behavioural interventions for the treatment of overweight or obese children from the age of 6 to 11 years Diet, physical activity, and behavioural interventions for the treatment of overweight or obesity in preschool children up to the age of 6 years Drug interventions for the treatment of obesity in children and adolescents Parent-only interventions for childhood overweight or obesity Surgery for the treatment of obesity in children and adolescents

HISTORY

Review first published: Issue 6, 2017

Date	Event	Description
11 October 2008	New citation required and conclusions have changed	This review concludes that combined behavioural lifestyle interventions compared to standard care or self- help can produce a significant and clinically meaningful reduction in overweight in children and adolescents The search was updated to May 2008. Some amend- ments were made to update the search strategies. No changes have been made to other aspects of the method- ology. Forty-six new studies have been included. These included information on drug interventions for treating obesity in adolescents. The added evidence suggests that lifestyle interventions appear to have positive effects in

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 418 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

		the treatment of child and adolescent obesity. Further- more, orlistat and sibutramine were found to have bene- ficial effects on adiposity in obese adolescents. However, a range of adverse effects was noted
3 July 2008	Amended	Converted to new review format. Authorship changed with new authors and new contact person

CONTRIBUTIONS OF AUTHORS

Lena Al-Khudairy (LA-K): acquiring trial reports, trial selection, data extraction, data analysis, data interpretation, review of drafts and future updates.

Emma Loveman (EL): acquiring trial reports, trial selection, data extraction, data analysis, data interpretation, review of drafts and future updates.

Jill Colquitt (JC): acquiring trial reports, trial selection and data extraction.

Emma Mead (EM): acquiring trial reports, trial selection, data extraction and screening trial alert.

Rebecca E Johnson (RJ): trial selection and data extraction.

Hannah Fraser (HF): trial selection and data extraction.

Omotayo Joan Olajide (JO): trial selection and data extraction.

Marie Murphy (MM): data extraction.

Rochelle Velho (RV): data extraction.

Claire O'Malley (CO): trial selection.

Liane Azevedo (LA): trial selection.

Louisa J Ells (LE): trial selection, review of drafts and update draft.

Maria-Inti Metzendorf (MIM): search strategy development and review of drafts.

Karen Rees (KR): trial selection, data extraction, data analysis, data interpretation, review of drafts and future updates.

DECLARATIONS OF INTEREST

LA-K: none known. EL: none known. JC: none known. EM: none known. RJ: none known. HF: none known. JO: none known.

MM: none known.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 419 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. RV: none known.

CO: none known.

LA: none known.

LE: Louisa Ells is seconded to Public Health England two days per week but undertook this review within her role as Reader in Public Health and Obesity at Teesside University.

MIM: none known.

KR: none known.

DIFFERENCES BETWEEN PROTOCOL AND REVIEW

Given the rapid growth in the treatment of child and adolescent obesity, the original review was split into six separate reviews, with a specific intervention and age focus.

- Diet, physical activity and behavioural interventions for the treatment of overweight or obesity in adolescents aged 12 to 17 years.
- Diet, physical activity and behavioural interventions for the treatment of overweight or obesity in children aged 5 to 11 years.
- Diet, physical activity and behavioural interventions for the treatment of overweight or obesity in infants aged 0 to 4 years.
- Drug interventions for the treatment of obesity in children and adolescents.
- Parent-only interventions for childhood overweight or obesity.
- Surgery for the treatment of obesity in children and adolescents.

For behaviour changing interventions, we included only randomised controlled trials that were specifically designed to treat obesity in children and observed participants for a minimum of six months. The rationale for introducing this criterion arose from the belief that many interventions appear to be effective in the short term (up to three months), but not in the long term (Glenny 1997). It seemed to be more important to evaluate the longer-term effects of treatments, as this would provide a more valuable indication of effectiveness, given the chronic nature of obesity.

We did not present prediction intervals as originally described for the suite of reviews for consistency as the other reviews did not do this either in consultation with the review group.

We did not perform the following sensitivity analyses.

Diet, physical activity and behavioural interventions for the treatment of overweight or obese adolescents aged 12 to 17 years (Review) 420 Copyright © 2017 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd. • Restricting the analysis taking into account risk of bias, as specified in the section Assessment of risk of bias in included studies section, but we did look at the effects of attrition bias and other potential bias introduced by analysis of cluster randomised controlled trials.

- Restricting the analysis to very long or large studies to establish how much they dominated the results.
- Restricting the analysis to studies using the following filters: diagnostic criteria, funding source and country.

This is in line with other reviews in this series.

ΝΟΤΕS

Part of the background, the methods section, appendices, additional tables and figures 1 to 3 of this review are based on a standard template established by the Cochrane Metabolic and Endocrine Disorders Group.
